LIVERPOOL 2023
ANNUAL SCIENTIFIC MEETING
8-10 MARCH 2023 • ACC LIVERPOOL

OUR EDUCATIONAL SUPPORT PARTNERS

PLATINUM SUPPORT EDUCATIONAL PARTNER

GOLD SUPPORT EDUCATIONAL PARTNER

SILVER SUPPORT EDUCATIONAL PARTNER

BRONZE SUPPORT EDUCATIONAL PARTNER

DEAR DELEGATE

It gives me great pleasure to welcome you to Liverpool for the 2023 BOFAS Annual Scientific Meeting. I work in Surrey, so why Liverpool? BOFAS has outgrown so many former venues that now few towns have anywhere large enough to accommodate us. I hail from a few miles north of Liverpool so it seemed natural to “bring it home”. The ACC is spacious but scalable, the City is brimming with interest and history (including orthopaedic) and this year there will be an extra, Eurovision, buzz in the air. The March weather on Merseyside can be glorious or brutal, so fingers crossed! Some members favour moving back to November but there would be some serious obstacles to overcome. It was easier to add four months to a year (James Davis might disagree) than it would be to have two Congresses in one calendar year or have a twenty-month gap. Having said that, the March clash with other Societies, especially BSCOS, is a problem requiring debate.

The theme this year is all about practical updates that all of us can either take away and apply the very next week, be it a surgical technique, an approach to reducing the stresses of work or a safer way to consent. We might of course already be doing the thing in question, but it's good to hear it confirmed. There will be little this year in the way of awe-inspiring procedures few of us will ever do. All the talks in the Ankle Arthritis session, for example, hold practical relevance for all of us whether we choose to develop a replacement practice or not. Having a Diabetes session is important. The population does not need every foot & ankle orthopaed to do complex Charcot reconstruction, but all of us must play a part in our services, or someone perhaps less suited will fill the void.

We are all reflecting on our work, our place within it in and how to achieve the best for our patients in ways perhaps we have not done before. You will see this acknowledged in the programme. BOFAS' newly created Equity, Diversity and Inclusion initiative is not just a “tick-box” exercise, not that Anna Chapman as Lead would ever allow it to be. On a very practical level, is BOFAS' work (and foot & ankle orthopaedics in general) as open to everyone whoever they are and whatever their circumstances as we would like to think? If not, BOFAS and our patients will not be benefitting maximally from the talent and drive out there. Related to this, at the AGM I will expand on the Working Groups initiative we have launched, opening up BOFAS projects to more members, especially the next generation, whilst maintaining structure and accountability.

I have included talks on topics highly relevant to our work that might not find a home elsewhere, but there is still plenty of solid surgical know-how, not least the rapid-fire “How I do...” session on Friday morning. You will regret making an early exit! Throughout, I have sought speakers who have a passion and expertise for their topics. I am particularly delighted to welcome Keynote speakers Dr Andrea Veljkovic, Associate Clinical Professor at the University of British Columbia, and Prof Alice Roberts, Professor of Public Engagement in Science at the University of Birmingham. There will be an even greater use this year of technology for

voting and information and further enhancements to the sustainability of our Congress. The larger venue provides more space for Industry and Workshops. By popular request part of Thursday morning is unprogrammed to allow consultants to attend the Workshops. This, along with the Wednesday Posters Viewing reception and the new Fellows' Fair session on Thursday is also an opportunity for the next generation to mix informally with more senior BOFAS members. Combined with the Working Groups initiative we hope to encourage younger colleagues to get a taste of the stimulating challenges available through BOFAS outside of our daily clinical work. Just like medicine itself, the Committees comprise very different activities, something to suit everyone. Whether you get a buzz out of teaching, designing research programmes, critiquing papers, political lobbying or applying technological advances in communication or data collection, you will find that it's done to internationally recognised standards by our awe-inspiring Committees. The BOFAS website contains ever-more information, so grab a coffee and have a browse.

Jo Millard and I checked out several potential venues for the Gala dinner but there was one clear winner. We are confident those attending will enjoy an unforgettable evening.

I offer my heartfelt thanks not only to Jo, without whom BOFAS would simply grind to a halt, but also to the Chairs and members of the Committees and to Members of Council, who have provided invaluable support and sage advice throughout the year while continuing the work for which BOFAS is increasingly recognised. I am also grateful to the staff and executive team at the Liverpool ACC for their professionalism and guidance. They could not have been more supportive.

I look forward to meeting you and I wish you a stimulating, enjoyable and memorable 2023 Congress.

Paul Halliwell

We share your focus

Just like you, Stryker is focused on
the complete spectrum of foot and ankle care

Ankle • Core • Minimally Invasive

GENERAL INFORMATION

Registration & Exhibition Timings

Day	Registration Open	Lunch	Meeting Close	Additional Events
Wednesday 8th March	08:00	13:00 - 14:00	18.00	18.00-19.00 Poster Viewing/Drinks reception 22.00-0.00 ToeJam Gig Live Lounge Cavern Club
Thursday 9th March	08:00	12:00 - 12:45	18:00	19:30 - 23:00 Gala Dinner, Anglican Cathedral
Friday 10th March	08:30	11:30 - 12:00	13:30	

On registration you will receive a badge, a lanyard and a pen.
There will be no paper programme or bags at this year's conference.
A PDF Version of the programme can be found on the BOFAS website Annual Meeting page or on this APP.

Speaker Preview

Speaker preview can be found in Room 10 on the first floor. If you are a speaker, please ensure you go to the speaker preview room at least 1 hour before the session starts to check your presentation.

Gala Dinner Tables

Buses will be provided from 19:10hrs outside the Pullman Hotel for transfer to the Cathedral.

A drinks reception will be held from 19.30hrs in the Lady Chapel. The gala dinner will be held in The Well at the Anglican Cathedral.

Cloakroom

The cloakroom in the conference centre will be open between 08.00hrs – 18.00hrs daily and is located on the ground floor. This is chargeable per item.

Prayer Room

There will be a Prayer Room facility in Dressing Room 1.

Maternity Room

There will be a comfortable space for baby changing/feeding available in Dressing Room 2.

Trains

Visit <https://www.accliverpool.com/visiting-us/travelling-here/catch-the-train/further-information/> for further information and routes.

Local Taxis

United Taxis are recommended – visit <https://comcab.co.uk/liverpool/> for more details. Other taxi firms are available.

Parking

There is parking on site at the Bournemouth International Centre. <https://www.accliverpool.com/visiting-us/travelling-here/parking/further-information/>

CITY CENTRE MAP

- 01 ACC Liverpool - Conference venue & Pullman Hotel
- 05 The Cavern Club
- 11 Gala Dinner Venue - Anglican Cathedral
- 14 Leonardo Hotel (Formerly Jury's Hotel)

CPD Points

Wednesday 6 points, Thursday 6 points, Friday 4 points.

A certificate of attendance is issued by email following the Annual Meeting on completion of the Feedback Survey, which can be found on the conference App.

The survey will close 1 month following the meeting. **No certificates will be available after this time.**

Badge Types

Refreshments

Tea and coffee will be served daily in the exhibition areas shown on the Exhibition Plan during the morning and afternoon break. The Exhibition will be held in the Hall 2A.

Lunch will be served on Wednesday and Thursday in the exhibition areas shown as black blocks on the Exhibition Plan. The Exhibition will be held in the Hall 2A.

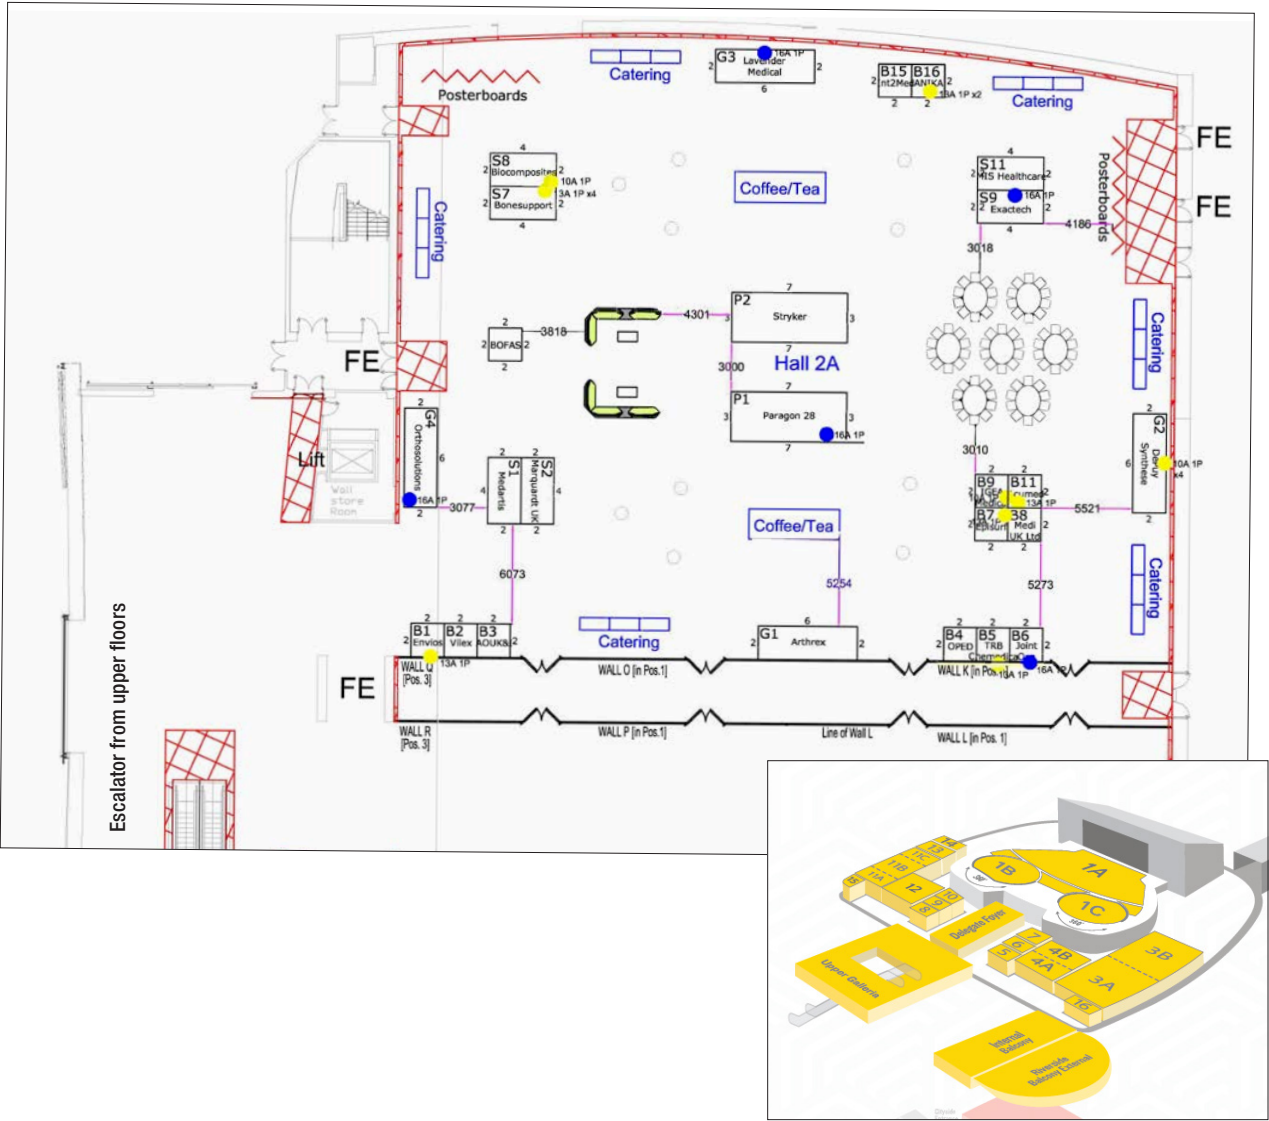

Brunch will be served in the Exhibition area on Friday during the midmorning break due to programme timings. The Exhibition will be held in the Hall 2A.

POSTER LOCATIONS

Posters can be found on the Lower Ground Floor Exhibition Area.

- P1. Opposing Flanks versus Parallel flanks – The influence of headless screw design on compression and pull-out resistance.
- P2. A guide for surgeons to orientate the ideal trans-syndesmotic fixation – a novel technique based on CT.
- P3. One stop MDT Foot and ankle clinic: Our experience and results.
- P4. Salvage of failed total ankle replacement using a custom 3D printed titanium truss cage: a case series and suggested treatment pathway.
- P5. A modular augmented arthroplasty system to manage larger bone defects in the ankle: a case series.
- P6. The outcomes of complex primary Inbone total ankle replacement.
- P7. Retrospective Cohort Study of Union Rate in Tarsometatarsal Joint Arthrodeses.
- P8. COSMIC feasibility study - Comparing Open Scarf osteotomy and Minimally Invasive Chevron Osteotomy for Hallux Valgus Correction.
- P9. A retrospective comparison of single screw vs dual screw fixation of medial malleolus fractures on rate of non-union and malreduction.
- P10. Outcomes from Tibiototalcalcaneal Nailing versus Open Reduction Internal Fixation for High-Risk Fragility Ankle Fractures: A Single-Centre Matched Retrospective Cohort Study.
- P11. Readmissions and complications following total ankle replacements: A data linkage study using the National Joint Registry and NHS Digital.
- P12. Risk factors for failure of total ankle replacements: A data linkage study using the National Joint Registry and NHS Digital.
- P13. Outcomes following extracorporeal shockwave therapy for the treatment of insertional and non-insertional Achilles tendinopathy at 2 year follow-up: A retrospective review.
- P14. Ankle Fusion and Ankle Replacement - Variations in surgical practice across England.
- P15. Wasting everyone's time – an observational study of current practice after injections.
- P16. Rivaroxaban vs LMWH after Elective Foot and Ankle Surgery – audit and experience from a tertiary referral centre.
- P17. Tibialis Posterior Tendon Entrapment in Posterior Malleolar and Pilon injuries of the ankle: A retrospective analysis.
- P18. The arterial risk posed by the posterolateral approach to the ankle. An Anatomical Cadaveric Observational Study.
- P19. Medium term results of open Autologous Matrix-Induced Chondrogenesis (AMIC) procedure in Osteochondral lesions of the Talus.
- P20. 5th Metatarsal Fractures; who do we need actually need to see? A single centre experience.
- P21. Is there improvement in Plantar Pressures patterns following Total Ankle Replacement? - A prospective novel 1 Year follow up study.
- P22. Total Ankle Replacement: The effect on Gait and Physical Activity - A prospective 1 Year follow up study.
- P23. Does Total Ankle Replacement help to improve physical activity in patients 2 year post-operatively? - A pilot activity monitoring study.

PLATINUM/GOLD SPONSOR WORKSHOPS

THURSDAY 9TH MARCH

ORTHOSOLUTIONS

Advancing foot and ankle care using the Volition™ ankle plating system.

Room 11a, Level 1 Upper Galleria, ACC Liverpool

09:00-10:30 Advancing foot and ankle care using MeshWorks, 3-D printed, patient specific implants for significant bone loss

Topics including:

- Preparation planning and patient selection.
- Advancements in ancillary tools
- Evolution of implant designs - Fusion cages to TTR.

Speakers: Mr Mark B Davies BM, FRCS, FRCS (Tr & Orth)
and Mr Jitendra Mangwani MBBS (Gold Medal) MS (Orth) FRCS (Tr&Orth)

11:00-12:00 Advancing foot and ankle care using the Volition™ ankle plating system

Nuances and benefits including:

- Accurate fixation methods
- Surgery time efficiencies
- Fibular lengthening techniques
- Trouble-shooting for the complex tri-malleolar fracture case and beyond.

Speaker: Professor Lyndon Mason MB BCh, MRCS (Eng), FRCS (Tr&Orth), FRCS (Glasg)

STRYKER

Take a Stand with Stryker and Standing CT.

Room 3a, Level 1 Upper Galleria, ACC Liverpool

11:00 Presentations and round table discussion of weight-bearing CT in practice, from Total Ankle Replacement to Hallux Valgus, including how to get access for your hospital.

Panel: Chris Blundell / Andy Goldberg / Lee Parker / Dave Townshend / Matthew Welck

PARAGON28

Ankle Fracture: Best Practice & Algorithms for Clinical Success

Room 3b, Level 1 Upper Galleria, ACC Liverpool

09:30-11:00 Session One
11:00-12:30 Session Two

Please join one of our sessions to explore and discuss the various challenges to ankle fracture management. We will be highlighting best practice techniques with multiple fracture pathologies as well as soft tissue considerations. There will be clinical discussions, case study presentations as well as workshop options during each session. Highlights will include topics as:

- Fracture Management Algorithms and Surgical Approaches
- Implant Selection: Benefits of Anatomical Plating Options
- Soft Tissue Considerations: Syndesmotic and Deltoid Repairs
- Consequences of the Poorly Managed Fracture: Getting it Right the First Time

Faculty: Prof. John Wong, Karan Johal, Lucky Jeyaseelan
and Mark Davies (Joining for Session Two)

ARTHREX WORKSHOP

Minimally Invasive Foot Surgery Forum.

Room 4b, Level 1 Upper Galleria, ACC Liverpool

10:30-12:00

Receive the opportunity to hear first-hand from some of the experts in minimally invasive foot surgery, what it takes to master the MIS learning curve. What are the most important things they have learnt along the way and how it can really transform your practice once you have mastered the technique. Further to that, learn how to take the next step into approaching advanced minimally invasive techniques such as minimally invasive bunion surgery and why it really is, worth all the hype.

- Where it all began and where we are now
- Beginning your MIS journey
- When to take on the minimally invasive bunion
- Learning minimally invasive surgery today
- Emerging techniques
- Round table case discussions

Faculty: Lloyd Williams, John McKinley, Richard Freeman, Peter Robinson

PLATINUM/GOLD SPONSOR WORKSHOPS

THURSDAY 9TH MARCH

DEPUY SYNTHES

Continuous compression fixation – a new concept in foot & ankle surgery and its applications

Room 4a, Level 1 Upper Galleria, ACC Liverpool

DePuy Synthes symposium with sawbone workshop.

Speaker: Mr. Senthil Kumar

LAVENDER MEDICAL

2023 Technology Update

Room 11c, Level 1 Upper Galleria, ACC Liverpool

09:00 Emerging Insights on first and lesser toe MPJ implant arthroplasty

Speaker: TBC

11:00 Triway hindfoot nail – Maximising implant features and benefits

Speaker: Mr Ed Gee

Notes:

FACULTY BIOGRAPHIES

Dr Amit Anand

Dr Amit Anand is an internationally recognised Sports Psychiatrist by the International Society of Sports Psychiatrist and is the first psychiatrist in the UK who has been achieved distinction in Diploma in Mental Health in Elite Sports by International Olympic Committee in 2021.

Dr Amit Anand trained in rehabilitation, general and sport psychiatry in the UK. He combined with a career playing under-19 cricket in India. He received state honours before he started his medical school in India. He moved to the UK for higher studies and completed CCT in Rehabilitation Psychiatry in the UK. This has enabled him to develop his passion for the mental health of elite performance in sport. He is a member of the Royal College of Psychiatrists and a member of the Sports and Exercise Special Interest Group since its inception.

Dr Amit Anand works as part of the small team of experts at Cognacity who tend to the psychiatric needs of elite athletes. Since 2018, Dr Anand has been involved in the mental health assessments of elite athletes, including Premier League Football, Premier League Rugby, Cricket (England and Wales Cricket Board), British Athletics, Scottish Professional Association. Dr Anand is also nationally recognised as an accomplished expert witness in a wide range of medico-legal areas including high profile sports disciplinary matters.

Dr Anand has been a member of the Therapeutic Use Exemption Committee Panel for European Tours since 2019. He has an expertise in the assessment and the management of ADHD in elite athletes. He has successfully applied for the TUE applications for elite sports to Anti-doping UK.

Dr Anand has been developing an app for elite sports to improve their mental health literacy.

In his downtime, watching sport, playing cricket, and trying to keep up with the next generation of Anands helps to keep him balanced.

Jo Benfield

Jo Benfield is an Extended Scope Physiotherapist in the Foot and Ankle Unit at the Royal National Orthopaedic Hospital (RNOH) in Stanmore. She is an Honorary Clinical Lecturer at University College London, and is a committee member of the Association of Foot and Ankle Physiotherapists (AFAP).

Meg Birks

Meg Birks is a Consultant Orthopaedic Hand & Wrist Surgeon in Sheffield where she works as part of an Orthoplastic integrated Hand Surgery service. She has previously been clinical lead for the Hand Surgery team and is now the governance lead. She is an educational supervisor, experienced mentor and appraiser.

Meg is also heavily involved with the British Society for Surgery of the Hand. She is the current Chair of the Education and Training Committee, past chair of the Diploma and Masters Committee and a previous Elected Member of Council. Most relevant to this session is her work on Equity, Diversity and Inclusion for the BSSH.

She has just completed a three year term as the inaugural EDI lead for the Society and during that time has established a range of structural habits and supported changes in thinking around EDI issues. There is always more to do but Meg hopes that by sharing her experiences with the BSSH journey thus far others will also be empowered to make some positive modifications in their own sphere's of practice.

Chris Blundell

Chris Blundell specialised exclusively in adult foot and ankle conditions and retired from clinical practice in April 2022 after 20 years of trauma and elective practice at The Northern General in Sheffield.

He carried out two fellowships in Foot and Ankle Surgery in Melbourne, Australia in 2001/2. He was awarded an Masters Doctorate for research into foot pressures. Chris is a Sheffield graduate whose higher surgical training was in Cambridge and Norwich in the UK.

Chris Blundell was born in London, and raised in Reading before studying medicine at Sheffield University. Halfway through his medical degree Chris did a BMedSci degree in Orthopaedic Bioengineering, one year later with a First Class Honours Award he decided that Orthopaedics was for him.

Chris was appointed consultant at The Northern General Hospital in Sheffield in 2002. Chris has over 50 peer reviewed publications in foot and ankle conditions. He has been the Principle Investigator on 4 National Institute for Health Research funded portfolio studies in foot and ankle conditions.

Managerially in the NHS, he was the clinical lead for the Sheffield Foot and Ankle Unit for 20 years, lead for commissioning for the orthopaedic department of Sheffield Teaching Hospitals, lead for the Sheffield Teaching Hospitals Department of Orthopaedics Research Activity and a Service Improvement Lead. For Private Practice he is the past Chairman of the Medical Advisory Committee of Claremont Private Hospital in Sheffield and the former Chairman of Sheffield Orthopaedics Limited.

Nationally, Chris is a Past President (2016-17) of BOFAS, (British Orthopaedic Foot & Ankle Society) and a past Chairman of The Education Committee of BOFAS.

Jodie Breach

Jodie is the National Physiotherapy Lead for Nuffield Health. She works clinically at the Cheltenham Nuffield Health Hospital, where she specialises in foot and ankle rehabilitation for both orthopaedic and musculoskeletal injuries, working with her orthopaedic and sports medicine consultant colleagues. She also is a committee member of the Association of Foot and Ankle Physiotherapists (AFAP) and has worked with them for the past 5 years to help organise learning events with BOFAS to improve the overall quality of foot and ankle rehabilitation. She has a passion for evidence based rehabilitation having completed a masters in clinical research in 2021.

Rick Brown

Rick Brown is the Clinical Lead of the Foot & Ankle Unit at The Nuffield Orthopaedic Centre, Oxford. His practice covers all areas of Foot & Ankle surgery including sports injuries, neurological conditions, complex forefoot pathology, arthritis including arthroplasty and deformity correction as well as the teenage and young adult ankle. He graduated from the University of Cambridge and King's College Hospital, London, before completing orthopaedic training on the Middlesex & Stanmore Rotation, London and then Fellowships in Sydney and at Harvard, USA. After appointment as a Consultant Orthopaedic Surgeon in 2004, he established the new Foot and Ankle Service in Cheltenham and ran a Regional Paediatric Foot Clinic at Bristol Children's Hospital. He is passionate about Foot & Ankle education having served for nearly ten years BOFAS Education Committee, including as Chairman. He has been an Examiner for the FRCS (Tr & Orth) for ten years and for COSECSA. He is now an Assessor of the Examiners. He is a Honorary Senior Clinical lecturer for the University of Oxford, where he runs the Foot & Ankle Fellowship programme. He has written numerous academic papers and several book chapters as well as lecturing across the UK and the world. He is the President of BOFAS in 2023.

Jim Carmichael

Jim Carmichael is a fellowship trained consultant orthopaedic Surgeon at North West Anglia NHS Foundation Trust (NWAFT) specialising in the care of foot and ankle conditions.

He graduated from Nottingham University Medical School in 1997 and completed the Basic Surgical Rotation in the Nottingham region. He relocated to Wessex in 2002 for his Higher surgical training completing a masters in orthopaedic engineering before undertaking fellowships in Sydney and London. He was appointed as a consultant orthopaedic surgeon in Peterborough in 2010 where his practice covers the breadth of adult foot and ankle surgery and he has led the creation of the NWAFT diabetic foot service.

Jim has a keen interest in medical education and research. He is the research lead for orthopaedics in NWAFT and is an active member of the International Bone Research Association teaching on numerous international courses and acting as IBRA course and fellowship director since 2018. He has participated in numerous BOFAS principles courses as well as the highly successful lectures of distinction series.

Anna Chapman

Anna Chapman is a Consultant Trauma and Orthopaedic Surgeon at University Hospitals, Coventry and Warwickshire, with a specialist interest in Foot and Ankle surgery.

She qualified from Guy's, King's and St. Thomas's Hospitals School of Medicine in London and completed her Orthopaedic training on the Warwick rotation. She undertook Fellowship training in Bournemouth and Bristol, and was appointed as a Consultant in 2012.

She completed a Masters Degree in Medical Education at the University of Warwick in 2010 and continues to pursue her interest in all things educational. Anna has been the Training Programme Director for the Warwick Orthopaedic Specialist Training Programme since 2018, and has served two terms on the BOFAS Education Committee. She is currently the Lead for Equality, Diversity and Inclusion for BOFAS.

Callum Clark

Callum Clark did his medical training at Cambridge University and surgical training in and around North West London, finishing with a year on a travelling fellowship in Foot and Ankle Surgery and Sports injuries in Melbourne, Australia. He started as Consultant Trauma and Orthopaedic Surgeon at Heatherwood and Wexham Park Hospitals (now part of Frimley Health NHS Trust) in 2004. For ten years he undertook Foot, Ankle and Knee surgery and since 2014 has exclusively practised Foot & Ankle surgery.

His clinical interests include arthroscopic techniques, sports injury management, ankle fusion and replacement, flatfoot disorder, and complex bunion surgery and he has published and presented on several of these topics.

He has held a number of leadership roles locally and nationally including his current role of Foot and Ankle lead at his NHS Trust. His main interest is in education, particularly at senior trainee and fellowship level and he has co-founded and run a successful foot and ankle surgical fellowship since 2007. He is also currently the Chair of the Education Committee of BOFAS. He also sits on the Education Committee of the American Orthopaedic Foot & Ankle Society (AOFAS).

Robert Clayton

Robert Clayton took up post as a Consultant Orthopaedic Foot & Ankle Surgeon in Fife in 2010. He has a highly specialised elective and trauma foot and ankle practice. He has an active role in postgraduate medical education and orthopaedic research. He has served on the BOFAS council as Director of Media and Communications since 2017, having previously served on the Scientific Committee for three years. He has served on faculty at numerous courses and conferences both for BOFAS and for other regional, national and international foot and ankle societies.

Tim Clough

Tim Clough qualified from the University of St Andrews, Scotland and Manchester, completing his orthopaedic training in Canada with an International arthroscopy and sports medicine Fellowship. He is an NHS Consultant at Wrightington Hospital, where his practice consists of ankle arthroplasty and fusions, revisions, complex hindfoot surgery, forefoot reconstruction, sports injuries and arthroscopy.

Mr Clough has published across a range of foot and ankle conditions, is Clinical Supervisor and trainer to the Wrightington Fellow on BOA Orthopaedic Leadership programme, is an elected member of the Outcomes Committee of the British Orthopaedic Foot and Ankle Society, is recently appointed Editor-in-Chief of the journal 'The Foot', is a reviewer for the BJJ and FAI, has sat as External Examiner for the School of Medicine BMSc programme at the University of Dundee and is Honorary Senior Lecturer at the University of Salford.

Verity Curral

Verity trained in Bristol as far as fellowships, which were in Windsor and King's College Hospital, where she was the first diabetic foot fellow. She has been a consultant in Luton and Dunstable Hospital since 2016 and, along with Dr Ritwik Banerjee, started the multidisciplinary diabetic foot team in 2017. She was elected to BOFAS EdComm in 2022.

Mark Davies

Since January 2006, Mark has been a Consultant Orthopaedic Surgeon at Sheffield University Teaching Hospitals, UK. He qualified from the University of Southampton in 1993 and undertook basic surgical training in London, Oxford and Swindon prior to commencing Orthopaedic training in Sheffield. He is both Fellowship trained in Limb Reconstruction techniques (Sheffield) and in elective Adult Foot & Ankle surgery (Brisbane). He is actively involved in implant design and has a specific interest in additive manufacturing processes for custom solutions. He has published extensively on many aspects of foot and ankle surgery. He is the current Honorary Secretary of British Orthopaedic Foot & Ankle Society (BOFAS) and a former Chairman of Sheffield Orthopaedics Ltd.

Chris Drake

Chris Drake is a HEE/NIHR Clinical Doctoral Research Fellow. His clinical role is an advanced practice physiotherapist, working across physiotherapy and trauma and orthopaedics: managing complex acute and chronic soft tissue pathologies of the foot and ankle.

Academically, Chris is studying for his PhD at the University of Leeds within the Leeds Institute for Rheumatic and Musculoskeletal Medicine (LIRMM). He is undertaking a study at the NIHR Leeds Biomedical Research Centre that will explore the mechanisms of action of plantar heel pain treatments, using state of the art MRI, gait analysis and clinical measures. Chris is the lead author on peer-reviewed, published articles on the associations between medical imaging features, and psychosocial factors, and plantar heel pain.

Will Eardley

Will Eardley is an academic orthopaedic surgeon. He has a specialist interest in orthopaedic trauma surgery and the management of post-traumatic complications including fracture fixation failure, nonunion, deformity and osteomyelitis.

Will trained in surgery throughout Northern England and completed his education with a year of fellowship experience before being appointed as Consultant Surgeon to the South Tees Hospitals National Health Service (NHS) Foundation Trust in 2014. Having left the British Army in the rank of Lieutenant Colonel after nineteen years of service, Will has worked in an operational capacity in Kosovo, Iraq and Afghanistan.

Will has an acknowledged reputation in orthopaedic trauma research, publishing numerous papers, letters and book chapters. He completed a master’s degree investigating fracture distribution in Road Traffic Accidents. He has also completed a formal period of study at the Defence Science and Technology Laboratory, successfully defending his thesis to be awarded Doctor of Medicine. He is a research associate at the Clinical Trials Unit at the University of York and is co-applicant on several NIHR funded research trials.

In his NHS practice, Mr Eardley consults on acute and chronic trauma management, with a range of patients under his care for significant limb injuries. Post traumatic deformity, fixation failure, nonunion and infection account for the bulk of his clinical work.

Will holds several senior positions of responsibility within United Kingdom Orthopaedic Trauma:

Vice-Chair British Orthopaedic Association Trauma Committee

Vice-Chair Royal College of Surgeons of Edinburgh Speciality Board

Orthopaedic Clinical Lead, National Hip Fracture Database

Trauma Audit Research Network Audit Committee Orthopaedic representative

Nick Gallogly

Nick Gallogly is one of only two recognised consultant orthotists in the UK. He specialises in biomechanics, gait analysis and the management of musculoskeletal and neuromuscular lower limb conditions. Nick first qualified in 2004 with a degree in Medical Mechanical Engineering from Dublin which predominantly focused on the medical application of biomechanics. He then qualified from Salford University with honours in Prosthetics and Orthotics. In early 2014 he attained a master’s degree in Clinical Biomechanics from Staffordshire University. Nick has a research interest in the identification and management tibialis posterior tendon dysfunction in primary care. He works in elite sport, supporting teams across rugby, football, rowing and athletics. Nick currently works as the head of service and clinical lead at the Royal Berkshire Foundation Trust Hospital

Ed Gee

Ed Gee graduated from Birmingham University, completed higher surgical training in Manchester and a post-CCT fellowship in Melbourne, Australia with BOFAS’ Fellowship Gold Award. He is a Foot and Ankle consultant at Salford Royal NHS Foundation Trust, Manchester’s major trauma centre where he has a comprehensive practice including complex foot and ankle trauma, degenerative conditions, foot and ankle conditions associated with metabolic syndromes such as MPS, diabetic foot and a sub-specialist interest in sports injuries of the foot and ankle. He has a strong role in education, examining for Manchester medical school, teaching on multiple national and international courses and was awarded “trainer of the year” in his second year as a consultant.

Andrew Goldberg

Andy Goldberg is a Consultant Orthopaedic Foot & Ankle Surgeon in London. He graduated from St Mary’s Hospital Medical School (Imperial College) in 1994 before completing his specialist training in trauma and orthopaedics on the RNOH North-East Thames. He was awarded an MD from the University of London in 2006. Following specialist fellowships in complex foot and ankle disorders in the UK, Europe and the USA he was appointed as a locum Consultant in 2009 and then in 2010 was appointed as an Honorary Consultant Orthopaedic Surgeon at the Royal National Orthopaedic Hospital NHS Trust in Stanmore and an Associate Professor at UCL. In 2011 he was awarded an OBE for services to medicine. Andy has helped raise more than £10m of research grants into health informatics; first in man studies into stem cell therapies (ASCAT); and NIHR HTA multicentre RCTs comparing ankle replacement against ankle fusion (TARVA); as well as examining and supervising PhD students. In 2018 he moved into full time independent practice at the Wellington Hospital in London but continues to run his research programmes at UCL and Imperial College London where he is a visiting Professor in Trauma & Orthopaedics. He sits on the outcomes committee for BOFAS, the National Joint Registry (NJR) Editorial Committee and Medical Advisory Committee and is an International Editor for Foot & Ankle International.

Paul Halliwell

Paul Halliwell graduated from Guy’s Hospital, London. His early training included Oxford, St. Thomas’ and St. George’s Hospitals, then Fellowship training at Great Ormond Street and in Toronto. He is consultant orthopaedic surgeon in Guildford, Surrey, specialising in conditions and trauma of the foot and ankle in both adults and children. He teaches at all grades from medical students to fellow consultants. He has been convenor and faculty on training courses in the UK and Europe including Surrey University cadaveric training courses and Ankle Replacement Courses. Paul has been FRCS (Tr & Orth) examiner and previously served on the Education Committee helping develop the Principles Courses, and as Chair of the Outcome Committee.

Paul was elected President of BOFAS in March 2022.

Jonathan Hobby

Consultant orthopaedic and hand surgeon Hampshire Hospitals Trust

Jonathan is a consultant hand and orthopaedic surgeon at the Hampshire Hospitals NHS FT. He graduated from St Thomas’s Hospital. He did his postgraduate training at St Bartholomew’s in London and on the University of Cambridge orthopaedic rotation. He completed an MD Thesis on the clinical effectiveness of MRI of the wrist and was awarded a Hunterian professorship by the Royal College of Surgeons of England in 2001. He is a member of the British Orthopaedic Association and was president of British Orthopaedic Trainees Association in 2000. He is on the AO faculty for long-bone and hand & wrist trauma.

Jonathan is an active member of the British Society for Surgery of the Hand (BSSH) and is the Immediate past president of the Society. He has served on BSSH council (2008 - 2011) and was honorary secretary (2016-19). He was the BSSH Stack travelling fellow in 2009 and the American Society for Surgery of the Hand travelling fellow in 2010. He has been chairman of the BSSH Instructional Courses and is chair of education for the European hand surgery federation (FESSH).

He is the speciality adviser to GIRFT for hand surgery, and is currently the clinical lead for the Hampshire and Isle of Wight elective orthopaedic program group His research interest include small joint replacement in the hand, imaging of the wrist, outcome measures in hand surgery and the impact psychological factors upon surgery. He has published three book chapters and 30 peer reviewed publications. He played rugby for St Thomas’s, and he still enjoys skiing (including racing with the Kandahar ski club), cycling and golf.

Lucky Jeyaseelan

Lucky Jeyaseelan is a Consultant Trauma & Orthopaedic Foot & Ankle Surgeon at Barts Bone & Joint Health, Barts Health NHS Trust. He is also an Honorary Senior Clinical Lecturer at Queen Mary University London (QMUL). He is the Chair of the SICOT Foot & Ankle Committee and also holds committee positions at the AOFAS and BOA.

Nikki Kelsall

Nikki Kelsall is a foot and ankle surgeon with a special interest in diabetic foot disease. She graduated from Bristol Medical School in 2001 and spent her first year as a doctor working in both Southmead and Frenchay Hospitals before moving to Liverpool to study for a Diploma in Tropical Medicine and Hygiene. She completed her specialist training in Wessex, her training was augmented with a yearlong Foot & Ankle fellowship at Bournemouth hospital and she was awarded a BOFAS (British Orthopaedic Foot & Ankle Society) international traveling fellowship for her time spent in Heidelberg and Bologna.

Nikki was appointed as a Consultant Trauma & Orthopaedic Surgeon at University Hospitals Dorset 2015. She also has an interest in Medical Education and is passionate about the development of future surgeons. She gained her Masters in Medical Education in 2014 and is Chair of the Specialty Training Committee for Wessex. More recently Nikki has started developing an interest in sports injury, she has completed a Diploma in Sports and Exercise medicine and is part way through training as a personal trainer to enable her to really focus on peri-operative health and performance following injury or surgery.

Togay Koç

Togay Koç is a Consultant Trauma and Orthopaedic Surgeon with a specialist interest in Foot & Ankle Surgery at University Hospital Southampton NHS Foundation Trust. He qualified from Guy’s, King’s and St Thomas’ Schools of Medicine in London before completing his orthopaedic training in the Wessex Deanery. He has been on Fellowships to Southampton, Oxford, Guildford and Frimley as well as a visiting Fellowship to the Harborview Medical Centre, Seattle, USA. He benefited greatly from the support he received from BOFAS during his training, fellowship and beyond including the BOA Future Leaders Programme. He is a member of the BOFAS IT Committee.

Dr Nikhil Kotnis

I am a Musculoskeletal Radiologist working at Sheffield Teaching hospitals since 2010. I did my Radiology training in Nottingham before completing a fellowship in MSK imaging at McMaster University in Hamilton, Canada.

My main interests are Sarcoma and Sports imaging. I am lucky to work with some excellent Foot and Ankle surgery colleagues in Sheffield who we meet with regularly and I learn a lot from. I am looking forward to contributing to the BOFAS meeting again.

Warren Macdonald PhD, CEng, CSci, FIPEM, FHEA

Warren Macdonald is an orthopaedic bioengineer with over forty years’ experience in clinical orthopaedics, research and industry; interested in implant and instrumentation design, fracture fixation devices and strategies and bone responses to system design and performance. Having worked in three hospitals (over eight years), three academic units (over 18 yrs.), in the implant industry as a bioengineer (for 2 yrs), and having worked as a Consulting engineer in Orthopaedic Bioengineering for fifteen years, Warren has wide experience in academic practice, the clinical application of engineering and the commercial medical device area.

Karan Malhotra

Karan Malhotra is a Consultant Orthopaedic Foot & Ankle Surgeon working at the Royal National Orthopaedic Hospital, Stanmore, UK. He graduated from Manchester with honours before beginning his core surgical and early registrar training in Yorkshire. He completed his registrar training on the Royal National Orthopaedic Hospital Training Rotation, London. He undertook Foot & Ankle Fellowships in Singapore, Melbourne and Stanmore. His practice covers all aspects of adult foot and ankle surgery, including complex deformity correction, ankle replacement, and treatment of neuromuscular conditions. He is actively involved with research, medical education and quality improvement. He is widely published, and his work has won national and international awards. He has also written book chapters and consensus publications. He is actively involved in cutting edge research with the Research Department of Orthopaedics and Musculoskeletal Science based at RNOH and affiliated with UCL.

Jit Mangwani

Jit Mangwani is a Consultant Orthopaedic Foot and Ankle Surgeon at University Hospitals of Leicester. He is the current Chair of the Scientific Committee of BOFAS. He has a keen interest in medical research and education. He has led the BOFAS- JLA 'Top-10' research priorities project. He is chief investigator for several outcome studies on ankle fractures, Achilles tendon rupture and other foot and ankle conditions. He is principal investigator for a number of multi-centre national studies. He has been conferred the title of 'academic champion and honorary fellow' by University of Leicester. He serves on the editorial board of several reputable orthopaedic journals. His contribution towards research in foot and ankle conditions has been recognised with several national and international prizes. He has published numerous articles in peer-reviewed journals and authored several chapters in books including AO manual of fracture management on Foot and Ankle Trauma. He is passionate about medical education and is involved in both undergraduate and postgraduate teaching and training. He is regularly invited as a faculty to national and international courses and conferences. He is actively involved in the training and teaching of General Practitioners and Allied Health Professionals.

Lyndon Mason

Prof Mason sits on council for the British Orthopaedic Foot and Ankle Society, as the Outcomes Committee chair, taking responsibility for the National foot and ankle registry.

Prof Mason qualified from the University of Wales College of Medicine, completing his orthopaedic training in Wales before moving to Liverpool as a consultant specialising in Major trauma and foot and ankle surgery. Before joining Liverpool University Hospital NHS Foundation Trust, Prof Mason completed British Orthopaedic Foot and Ankle Society travelling fellowships in the University of Utah, Salt Lake City, America and Carl Gustav Carus University, Dresden, Germany. In Liverpool, Prof Mason obtained the British Orthopaedic Foot and Ankle Society Gold Fellowship Award.

Prof Mason's pioneering research has become nationally and internationally recognised, winning 17 national and international prizes in the last 8 years. He has been awarded the Hunterian Professorship from the Royal college of surgeons in 2020 for his work on ankle fractures, the Robert Jones gold medal and Association prize in 2017 for his work on the evolution of the foot and the Jaques Duparc prize from EFORT for his work on discovery of a new foot ligament. Prof Mason has won the Chan Chen memorial prize, the highest award from the British Orthopaedic Foot and Ankle Society on 3 separate occasions.

Prof Mason is an Honorary Associate Professor at the University of Liverpool, where he is the undergraduate lead in Musculoskeletal disease and Orthopaedics for the School of Medicine. Furthermore, Prof Mason is a respected National educator, as an invited faculty member for courses by the British Orthopaedic Association, Royal College of Surgeons and British Orthopaedic Foot and Ankle Society.

Lee Parker

Lee is a Consultant Orthopaedic Surgeon at Bart's Health NHS Trust where he is the Clinical Lead and Fellowship Director of Foot and Ankle Surgery.

He is also a partner in One Welbeck Orthopaedics and The London Orthopaedic Clinic, based in Central London.

David Partridge

David is a Consultant Microbiologist at Sheffield Teaching Hospitals NHS Foundation Trust. He has special interests in infections of the immunocompromised host and antimicrobial stewardship. He has been lead Microbiologist for diabetic foot infection since 2016. He is Vice-President of the British Infection Association.

James Ritchie

James studied Medicine at Guy's & St Thomas's Medical Schools, History at UCL and Epicureanism anywhere he could find it. Appointed as a consultant in Tunbridge Wells in 2005 he has been variously described as a 'fine surgeon and teacher', 'the fat bloke with the six kids' and 'a whore to middle-class women's footwear'. Always happy to take one for the BOFAS team, James has represented the society on the NHS Digital Orthopaedic Expert Working Group since 2015 and so developed an interest in both NHS quantum and coding that borders on the unhealthy. In 2020, James was elected to the EFAS Council despite an Italian objection (that he wasn't Italian). He has pursued a modernising agenda ever since including a campaign to convince the Marseille-based Secretariat that 'mastication' isn't as rude as they think it is, and the introduction of reinforced tables at EFAS dinners to accommodate the choreographic demands of the Dutch society. James is still practising as an Orthopaedic Foot and Ankle Surgeon in Tunbridge Wells but aspires one day to stop practising and simply float along on a cloud of effortless superiority, as Consultants used to do when he was a houseman.

Alice Roberts

Professor Alice Roberts is a biological anthropologist, author and broadcaster. Having originally studied and practised medicine, she then became a university lecturer, teaching clinical anatomy and undertaking research in biological anthropology. She is especially interested in the intersection between biology, archaeology and history, the impact of ancient genomics in archaeology, and the interaction between humans and the environment through time.

She is passionate about public engagement with university research and teaching. She has been Professor of Public Engagement in Science at the University of Birmingham since 2012.

Alice has presented well over a hundred television programmes, on subjects ranging from biology and archaeology and history. Her television debut came as a human bone expert on Channel 4's Time Team, in 2001. After presenting Coast on BBC2, she went on to write and present a range of BBC series, including The Incredible Human Journey, Origins of Us, Prehistoric Autopsy and the long-running archaeology series, Digging for Britain, as well as several Horizon programmes. She also presents Britain's Most Historic Towns on Channel 4.

Alice has written eleven popular science books, including The Incredible Human Journey, Evolution: The Human Story, The Incredible Unlikelihood of Being, Tamed: Ten species that changed our world, Ancestors: The Prehistory of Britain in Seven Burials and Buried: An alternative history of the first millennium in Britain. Her latest book: Anatomical Oddities was published by Simon & Schuster in November 2022.

Alice has presented many radio programmes, including the environment strand Costing the Earth on Radio 4, and her own ten-part series about the history of anatomy: Bodies.

In 2020, Alice Roberts was awarded the Royal Society's first David Attenborough Prize for Public Engagement.

Photo Credit: Dave Stevens

Paul Sadler

Dr Paul Sadler is the Regional Postgraduate Dean for the South East, and the Local Postgraduate Dean for Thames Valley and Wessex.

Paul spent over 16 years in the British Army before he moved to work as a consultant in intensive care medicine and anaesthesia in Portsmouth Hospitals NHS Trust. During his military and NHS career, he has undertaken many educational and leadership roles as tutor, clinical director, programme director, local advisor, director of education, and deputy medical director, before becoming a postgraduate dean in late 2018. He undertakes national lead dean roles for Surgery, Professional Support and Wellbeing, and the Extended Surgical Team programme. He continues to be an active clinical teacher and clinician.

Anthony Sakellariou

I qualified from University College London in 1987. My surgical training was undertaken in London and Winchester. Passed FRCS (Eng) in 1992, FRCS (Orth) in 1996 and awarded CCST in 1999. My sub-specialty training in foot and ankle surgery was undertaken in Vancouver, Canada and the Mayo Clinic Scottsdale, Arizona, following which I was awarded the Certificate of Completion of Advanced Foot and Ankle Training by the American Orthopaedic Foot and Ankle Society.

I was President of BOFAS 2014-15 and have previously served BOFAS as Honorary Secretary and on its Education Committee. I currently sit on the Education Committee of EFAS and review articles for 'Foot and Ankle International'. I have published widely on many aspects of foot and ankle surgery. Ankle fractures and their management have been of particular interest to me since 2006.

I am joint lead clinical supervisor of the 'Surrey Foot and Ankle Fellowship' program.

I have worked as a Consultant Orthopaedic Surgeon at Frimley Park Hospital, Surrey, UK, since 1999, with a special interest in surgery of the foot and ankle.

Ian Sharpe

Ian Sharpe is a Consultant Foot, Ankle and Trauma Surgeon at the Princess Elizabeth Orthopaedic Centre, Exeter. He established the Foot and Ankle Unit in 2003, and it has grown to a team of five Foot and Ankle Consultants, supported by a multidisciplinary team. He was Lead Clinician for Trauma 2006-2010, and Clinical Director of the Orthopaedic Centre from 2014-2018. He is the main supervisor for a successful Fellowship programme in Foot and Ankle surgery – with an emphasis on arthroplasty techniques.

He was one of the first surgeons to introduce the Infinity Ankle replacement in the UK, and has established a primary and revision arthroplasty unit and referral network in the South West. He has published on primary and revision ankle arthroplasty and was on the BOFAS education committee from 2018-2022.

Hiro Tanaka

Hiro has worked in South Wales as a Consultant for the last 17 years. He is the Honorary Treasurer for BOFAS and is passionate about surgical education and promoting clinical leadership within the NHS. He is a Council member of the BOA and directs the BOA Future Leaders Programme which is designed for colleagues across the UK to lead positive change and to find true purpose in their career.

Heath Taylor

Mr Taylor qualified from Charing Cross & Westminster Medical School in 1994. His postgraduate surgical training was carried out in London on the North West Thames Specialist Registrar training programme. At the end of his training, he carried out sub-speciality fellowship training in complex foot and ankle surgery at the Royal National Orthopaedic Hospital, Stanmore. He was appointed to the Royal Bournemouth Hospital and Poole Hospital in 2004 as a Consultant Orthopaedic Surgeon with a specialist interest in complex foot and ankle surgery. Mr Taylor's current practice is almost exclusively related to conditions of the foot and ankle. This includes the management of complex trauma of the foot and ankle, as well as treating high level athletes and professional sportsmen and women. He also takes an active role in training the next generation of Orthopaedic Foot & Ankle Surgeons. Mr Taylor has previously been voted as the Wessex Region Trainer of the Year. Mr Taylor has been an invited lecturer at local, national and international meetings, including BOFAS, AOFAS & EGFAS. Mr Taylor is the immediate Past President of the British Orthopaedic Foot & Ankle Society, having been a member of council for the previous seven years. He advises on matters of national policy, ensuring that the highest standards of treatment are offered to patients suffering with foot & ankle conditions.

Dave Townshend

Dave Townshend was born in Edinburgh and graduated from the University of Newcastle upon Tyne. After a research fellowship in New Zealand and a foot and ankle fellowship in Vancouver he returned the North East where he was appointed in 2010 as a Consultant at the Northumbria NHS Healthcare Foundation Trust. Dave was elected to the BOFAS Scientific Committee in 2016 and is the Clinical Director for R&D in Northumbria.

Andrea Veljkovic

Dr. Andrea Veljkovic is an Associate Clinical Professor at the University of British Columbia. She is the Fellowship Director for the Adult Foot and Ankle Reconstruction Fellowship program and Research Director of the UBC Orthopaedics training program. Dr. Veljkovic has been in full time academic subspecialty surgical practice for more than ten years. Her particular interests are in joint preservation and lower extremity sport injuries and arthroscopy. She maintains a sport knee and sport foot and ankle affiliation with the UBC varsity sport teams. Her particular interests are in cutting edge surgical techniques, realignment procedures, and biologics interventions joint preservation of the foot and ankle through the use of minimally invasive techniques.

Professional Highlights

Dr. Veljkovic has received numerous awards for teaching and education, including the UBC Teaching Award. She was the recipient of two prestigious orthopaedic travelling fellowship awards from the Canadian and American Orthopaedic Associations and she recently received the AOFAS womans leadership award. She has published over 85 scientific papers and has lectured extensively. Recently, her research was nominated as a finalist for the AOFAS Leonard Goldner and Roger Mann Awards.

Alex Wee

Alex Wee is an orthopaedic and trauma consultant surgeon. After fellowships in Addenbrookes and Stanmore, he commenced at Frimley Park Hospital in 2006. He has a specialises in foot and ankle surgery with niche interests in diabetic foot infection and Charcot foot reconstruction, neurological foot deformity, complex hindfoot deformity. He also undertakes routine foot and ankle procedures.

He is the orthopaedic clinical lead for diabetic foot surgery and part of the diabetic MDT.

Alex has presented at AOFAS, BOFAS, and has been an invited speaker nationally and internationally. He has been a faculty member for the Malvern, King's, Essex diabetic foot conferences and the BOFAS principles course.

He has consulted on how to set up and organise the Diabetic foot MDT. He runs a surgical visitation for both UK and international surgeons who wish to observe the MDT service and surgery. Alex is the founder and co chair of the Surrey Ankle Society, a group that meets quarterly to present challenging cases.

He is one of the supervising consultants for the Surrey foot and ankle fellowship and is involved in registrar training and education.

Alex is a published author with book chapters and several papers to his name.

Matt Welck

Matt Welck is a consultant orthopaedic foot and ankle surgeon at the Royal National Orthopaedic Hospital in Stanmore. He is also an honorary associate clinical professor at UCL.

He graduated from Leeds University Medical School with a medical degree. He also has first class honours with distinction in both Bachelor of science and a Master of science degrees.

He is involved in foot and ankle surgery teaching and convenes two national foot and ankle surgery courses. He is also involved in foot and ankle research, and regularly presents his work nationally and internationally.

Robert Lloyd Williams

Mr R. Lloyd Williams is a Consultant Orthopaedic specialising in Foot and Ankle Disorders. He also treats general trauma.

Mr Williams is a founding Partner of The London Orthopaedic Clinic (TLOC) and a pioneer in Minimally Invasive Foot and Ankle Surgery (MIS) techniques in the field of Foot and Ankle Surgery.

B&FAS PROGRAMMES

DAY 1: WEDNESDAY 8TH MARCH 2023

Time	Event	Speaker
08:00-08:45	Registration	
08:45-09:00	Welcome	Paul Halliwell
09:00-10:45	INSTRUCTIONAL 1 - THE DIABETIC FOOT: <i>Chairs: Maneesh Bhatia / Julie Kohls</i>	
09:00-09:15	Principles of urgent treatment, debridement and amputation	Verity Currall
09:15-09:30	The role of the circulation inc Charcot and vascularity	Hani Slim
09:30-09:45	Charcot: science, practicalities- what, when & by whom?	Alex Wee
09:45-10:00	Combatting the bacteria: update on choice & use of antimicrobials	David Partridge
10:00-10:15	Treating diabetic patients for non-diabetic foot problems	Robert Clayton
10:15-10:30	Team working across the Units, Regions and Nationally	Nikki Kelsall
10:30-10:45	Questions/discussion	
10:45-11:15	Coffee/Tea - Hall 2a, Lower Ground Floor	
11:15-11:40	KEYNOTE LECTURE 1 Ankle Fusion; Arthroscopic vs Open	Andrea Veljkovic
11:45-13:00	FREE PAPERS 1 <i>Chairs: Dev Mahadevan / Adam Sykes</i>	
13:00-14:00	Lunch - Hall 2a, Lower Ground Floor	
14:00-15:15	INSTRUCTIONAL 2 - IMPROVING OUR OUTCOMES: APPLYING THE SCIENCE <i>Chairs: Graham Chuter / Yaser Ghani</i>	
14:00-14:12	Optimising patients physically	Togay Koc
14:12-14:24	Optimising patients psychologically	Jonathan Hobby
14:24-14:36	Improving the fusion rate of arthrodesis	Dr Warren Macdonald
14:36-14:48	Post-operative weight bearing. When can we / should we?	Rick Brown
14:48-15:00	Using imaging to improve surgical outcomes	Karan Malhotra

Notes:

DAY 1: WEDNESDAY 8TH MARCH 2023

Time	Event	Speaker
15:00-15:15	Day surgery for major foot and ankle procedures - need of the hour	Jit Mangwani
15:12-15:30	Questions/discussion	
15:30-16:00	Coffee/Tea - Hall 2a, Lower Ground Floor	
16:00-17:10	INSTRUCTIONAL 3 – THE CHANGING WORKPLACE: CHALLENGES AND OPPORTUNITIES <i>Chairs: Tim Williams / Amit Patel</i>	
16:00-16:13	A sustainable career: keeping interested & healthy for 40 years	Hiro Tanaka
16:13-16:23	EDI - what it is and why it matters to surgeons	Meg Birks
16:23-16:30	EDI for the Specialist Societies - a strategy for BOFAS	Anna Chapman
16:30-16:36	Questions/discussion	
16:36-16:48	How to avoid being (successfully) sued	Heath Taylor
16:48-17:00	Surgical Podiatry	Paul Halliwell
17:00-17:10	Questions/discussion	
17:10-17:50	KEYNOTE LECTURE 2: THE CHANGING WORKFORCE: NEW PATHS, NEW ROLES	Paul Sadler
17:50-18:00	Questions/discussion	
18:00-19:00	Poster viewing - Presidential Walk Around	Hall 2a, Lower Ground Floor

Notes:

DAY 2: THURSDAY 9TH MARCH 2023

Time	Event	Speaker
SESSION 1: CONSULTANTS SESSION		
09:00-09:15 09:15-09:30 09:30-09:50	Measuring our work: Coding: opportunites & challenges. PROMS Registry Update; the present & future NJR Update	James Ritchie Lyndon Mason Andrew Goldberg
09:50-10:30	OrthoVision 2023 Topic 1: The moderate bunion - why would you use MIS? <i>Lloyd Williams and Anthony Sakellariou</i> Topic 2: The young arthritic ankle - why don't we replace? <i>Tim Clough and Andy Goldberg</i> Topic 3: The undisplaced lisfranc - why should we operate? <i>Chris Blundell and Callum Clark</i>	Ed Gee
SESSION 2: AHP SESSION		
09:00-12:00	AHP Meeting	
SESSION 3: REGISTRARS/FELLOWS SESSION		
09:00-10:30	Registrar/Fellows Research session	
SESSION 4: INDUSTRY WORKSHOPS		
08:30-12:00 10:30-11:00	Industry Workshops Coffee/Tea - Hall 2a, Lower Ground Floor	
12:00-12:00	Lunch - Hall 2a, Lower Ground Floor	
SESSION 5: AGM - HALL 1A		
13:00-14:50	AGM - Full members only	
SESSION 6: AHP SESSION - HALL 1B		
13:00-14:50	AHP Meeting	
SESSION 7: REGISTRARS/FELLOWS SESSION - HALL 1C		
13:00-14:50	Registrar/Fellows session	

DAY 2: THURSDAY 9TH MARCH 2023

Time	Item	Speaker
14:50-15:25	Coffee/Tea - Hall 2a, Lower Ground Floor	
HALL 1A, LEVEL 1 UPPER GALLERIA		
15:25-16:10	FREE PAPERS 2 <i>Chairs: Rajesh Kakwani / Bobby Siddiqui</i>	
16:10-16:50	KEYNOTE LECTURE 3 <i>"Two legs good" exploring and exploding some of the myths about the evolution of human bipedalism.</i>	Professor Alice Roberts
16:50-17:00	Questions/discussion	
17:00-18:15	INSTRUCTIONAL 4 - ANKLE ARTHRITIS <i>Chairs: Vivek Dhukaram / Dan Marsland</i>	
17:00-17:12	Ankle Arthritis Networks. Ankle arthritis is different	Dave Townshend
17:12-17:24	What do we really know about Ankle OA anyway?	Callum Clark
17:24-17:36	Correcting deformity in the presence of ankle arthritis	Jim Carmichael
17:36-17:48	When a hindfoot fusion may be the best bet?	Mark Davies
17:48-18:00	Infections in fusions and replacement	Andrea Veljkovic
18:00-18:10	Questions/discussion	
19:30-23:00	Gala Dinner, Anglican Cathedral Buses from Pullman Hotel 19:10hrs	

Notes:

DAY 2: AHP PROGRAMME

THURSDAY 9TH MARCH 2023

HALL 1B, LEVEL 1 UPPER GALLERIA

Time	Event	Speaker
08:55-09:05	Introduction	Jodie Breach/ Dev Mahadevan

SESSION 1

Chair: Jodie Breach / Howard Davies

09:05-09:25	Pathophysiology and Epidemiology of Plantar Heel Pain	Jo Benfield
09:25-09:45	Conservative Management of Plantar Heel Pain	Chris Drake
09:45-09:55	Imaging of the plantar fascia	Dr Nik Kotnis
09:55-10:15	Orthotics considerations for plantar fasciopathy	Nick Gallogly
10:15-10:30	Discussion	
10:30-11:00	Coffee - Hall 2a, Lower Ground Floor	

SESSION 2

Chair: Nick Gallogly / Callum Clark

11:00-11:15	Are there different phenotypes of Plantar Heel Pain?	Chris Drake
11:15-11:45	Surgical and Injection Options for Plantar Heel Pain	Matt Solan
11:45-12:00	Discussion	
12:00-13:00	Lunch - Hall 2a, Lower Ground Floor	
13:00-14:00	Case Discussion <i>Chair: Howard Davies</i> <i>Panel: Howard Davies / Jit Mangwani/ Chris Drake / Nick Gallogly</i>	
14:00-14:30	Bone stress injuries of the foot	Jodie Breach
14:30-14:45	Discussion and close	
14:45-15:25	Coffee - Hall 2a Lower Ground Floor	

DAY 2: FELLOWS & REGISTRARS

PROGRAMME

THURSDAY 9TH MARCH 2023

HALL 1C, LEVEL 1 UPPER GALLERIA

Time	Event	Speaker
09:00-09:05	Introduction	Sarah Johnson-Lynn
09:05-09:40	Research as a full-time clinician – meta-analysis & systematic review	Raju Ahluwalia
09:40-09:50	Questions	
09:50-10:10	Collaborative studies	Will Eardley
10:10-10:30	Commercial studies	Dave Townshend

10:30-11:00	Coffee break - Hall 2a, Lower Ground Floor	
10:30-13:00	Fellows Fair – meet the fellowship trainers	BOFAS Stand Exhibition Hall
12:00-13:00	Lunch - Hall 2A Lower ground floor - Exhibition Hall	

EDUCATION SESSION

Chairs: Caroline Bagley / Krishna Vemulapalli

13:00-13:10	The great debate – I won't do ankle replacement in these situations	Dave Townshend
13:10-13:20	The great debate – I won't do ankle fusion in these situations	Ian Sharpe
13:20-13:30	Ankle arthritis case discussions	Shilpa Jha/ Caroline Bagley
13:30-13:40	Questions	
13:45-13:55	I wish I was not on-call – Extruded talus: tips and tricks	Lee Parker
13:55-14:00	Questions	
14:00-14:10	Pains, groans and psychic moans of midfoot sprains & fractures	Lucky Jayaseelan
14:10-14:15	Questions	

LIFE AS A NEW CONSULTANT

Chairs: Shilpa Jha / Krishna Vemulapalli

14:15-14:25	Role of social media in T&O: Do's & Don'ts; Rules & regulations	Matt Welck
14:25-14:35	Pensions & Union	Stuart Lythgoe
14:35-14:45	Indemnity	Stuart Lythgoe
14:50-15:25	Coffee - Hall 2A Lower ground floor - Exhibition Area	

DAY 3: FRIDAY 10TH MARCH 2023

Time	Event	Speaker
09:00-10:15	FREE PAPERS 3 <i>Chairs: David Loveday / Mike Barrett</i>	
10:15-10:45	KEYNOTE LECTURE 4 The Psychology of Elite Athletes	Dr Amit Anand
10:45-10:50	Questions/discussion	
10:50-11:05	Research Update	Jit Mangwani
11:05-11:30	Liverpool orthopaedics and Hugh Owen Thomas	James Ritchie
11:30-11:35	Preliminary results of BOFAS EDI Survey	Anna Chapman
11:35-12:05	Brunch/Coffee/Tea - Hall 2a, Lower Ground Floor	
12:05-13:05	HOW I DO... <i>Chairs: Anna Chapman / Callum Clark</i>	
12:10	Percutaneous Calc ORIF – using Plates	Edward Gee
12:15	Percutaneous fixation of calcaneal fractures using wires and screws	Robert Clayton
12:20	George Chami Tribute	Robert Clayton
12:25	Brostrum ligament reconstruction with an Internal Brace	Sam Singh
12:30	Staples for Midfoot Fusion	Ehab Keir
12:35	Simultaneous double Z-lengthening and medial displacement calcaneal osteotomy	John Wong
12:40	How I restore Fibula length in ankle fractures	Nijil Vasukutty
12:45	Reverse DMMOs for lesser TMTJ OA	Karan Malhotra
12:50	Deformity Correction with AAF	Andrea Veljkovic
12:55	Transligamentous approach for Talar Fractures	Lyndon Mason
13:05	Prizes and Presidential Handover	
13:30	Close of Meeting

Incidence, demographics, characteristics and management of acute Achilles tendon rupture

S. Briggs-Price¹, S. O'Neill¹, L. Houchen-Wolloff², G. Modha³, E. Fitzpatrick⁴, M. Faizi⁴, J. Shepherd⁴, J. Mangwani⁴

¹University of Leicester, School of Healthcare, Leicester, United Kingdom,

²Centre for Exercise and Rehabilitation Sciences, NIHR Biomedical Research Centre, Leicester, United Kingdom,

³University Hospitals of Leicester, Emergency Care, Leicester, United Kingdom,

⁴University Hospitals of Leicester, Orthopaedics, Leicester, United Kingdom

Introduction: Achilles tendon rupture (ATR) account for 10.7% of all tendon and ligament injuries and causes lasting muscular deficits and have a profound impact on patients' quality of life^{1,2}. The incidence, characteristics and management of ATR in the United Kingdom is poorly understood.

Method: Data was collected prospectively from University Hospitals of Leicester Emergency Department (ED) between January 2016 and December 2020 and analysed retrospectively. The medical records were reviewed to determine management protocols (surgical/non-surgical) and limited mobilisation (VACOPed™ boot) duration. Leicestershire population data was taken from Leicestershire County Council demography report³.

Findings: 277 individuals were diagnosed with an ATR during the 4-year period. The mean (SD) annual incidence was 56 (±6) ATR. An incidence rate of 8.02 per 100,000 people per annum. The average characteristics of those experiencing an ATR is male (78.3%), 46.8yrs old (±14.4), body mass index 29.1 (±6.3). Median (IQR) number of comorbidities 1 (2) and duration to present to ED was 0 days (1). The main mechanism of rupture was sporting activity (62.1%).

97.4% were non-surgically managed using a limited mobilisation boot (VACOPed). The boot was worn for an average of 62.6 days (±8.9).

94 participants provided pre-ATR Achilles symptoms data. 16% (n=15/94) of participants reported a previous contralateral ATR. 7.4% reported a re-rupture (n=7/94). 15.4% (n=14/91) reported an Achilles tendinopathy on the ipsilateral side prior to ATR. 7.7% (n=7/91) reported bilateral Achilles tendinopathy and 1.1% (n=1/91) reported contralateral Achilles tendinopathy prior to ATR.

Conclusion: The incidence of ATR is 8.02 cases per 100,000 people per annum. This is the first UK data on ATR incidence. Most ATR were managed non-surgically in this cohort. The majority of ruptures occurred during sporting activity. Those that had previous Achilles symptoms (24.2%) indicate tendons are not always asymptomatic prior to ATR.

FP2

Partial Achilles Tendon Tear – a figure of our IMAGination?

P. Seyed-Safi¹, O. Naji¹, R. Faroug², A. Beer³, A. Vijapur⁴, U. Oduoza⁵, K. Johal⁵, S. Mordecai⁵, R. Deol⁵, K. Davda⁴, N. Sivanadarajah^{3,3}, E. leong¹, B. Rudge¹

³Imperial College NHS Trust, London, United Kingdom,

⁴Buckinghamshire Healthcare NHS Trust, Reading, United Kingdom,

⁵East and North Hertfordshire NHS Trust, Stevenage, United Kingdom

Aim: Our collaborative study aims to demonstrate that acute partial Achilles Tendon Tears (ATTs) are not separate diagnostic entities from full ATTs. and should be thought of as a continuum rather than binary partial or full.

Methods: We pooled anonymised data from four hospitals, identifying patients with acute partial ATTs on USS reports from 2019-2021. Patients were only included if they had an acute injury and no previous background Achilles tendinopathy.

Results: 91 patients had acute partial ATTs reported on USS. 74/91 (81%) of patients had clinical findings in keeping with a full ATT (positive Simmonds test, palpable gap). 88/91 (97%) of patients were managed according to local full ATT protocols. 2 patients had MRIs – one showed no tear, the other showed a full rupture. 2 patients underwent surgical repair and both intra-operatively were found to have full ATTs.

Conclusion: Our regional data suggests that a significant proportion (81%) of USS diagnosed partial ATTs may in fact be misdiagnosed full ATTs. All injuries clinically suspicious for an ATT should be managed according to local Achilles Protocol. USS is useful to diagnose the presence or absence of a tear but is not good at differentiating partial vs full tear. There is significant tendon end fibrillation and overlap on USS of an acute full ATT, which can give the impression of a partial ATT. More research is needed into whether any threshold exists to support the current distinction of “partial” and “full” as relates to management and outcomes.

FP3

PATH-2 trial: platelet rich plasma for acute Achilles tendon rupture, two-year follow-up of the randomised, placebo-controlled, superiority trial

J. Alsousou¹, D. Keene², P. Harrison³, H. O'connor⁴, S. Wagland², S. Dutton⁴, P. Hulley⁵, S. Lamb⁶, K. Willett^{2,2}

¹Manchester University Hospitals NHS Trust, Manchester, United Kingdom,

²University of Oxford, Kadoorie Research Centre, Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Oxford, United Kingdom,

³University of Birmingham, Institute of Inflammation and Ageing, University of Birmingham, Birmingham, United Kingdom,

⁴University of Oxford, Oxford Clinical Trials Research Unit, Centre for Statistics in Medicine, Oxford, United Kingdom,

⁵University of Oxford, Botnar Research Centre, Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Oxford, United Kingdom,

⁶University of Exeter, College of Medicine and Health, University of Exeter, Exeter, United Kingdom

Background: The PATH-2 trial found no evidence of a benefit of Platelet Rich Plasma (PRP) injection versus a placebo after Achilles tendon rupture (ATR) at six-months. ATR often leave longer-term functional deficiencies beyond six-months. This study aim is to determine if PRP affect tendon functional outcomes at two-years after ruptu

Study design: Randomised multi-centre two-arm parallel-group, participant- and assessor-blinded, superiority trial.

Methods: Adults with acute ATR managed non-surgically were recruited in 19 UK hospitals from 2015 to 2019. Exclusions were insertion or musculotendinous injuries, leg injury or deformity, diabetes, haematological disorder, corticosteroids and anticoagulation therapy. Participants were randomised via an online system 1:1 to PRP or placebo. Primary outcome was Achilles Tendon Rupture Score (ATRS) at two-years. Secondary outcomes were pain, Patient-Specific Functional Scale (PSFS), SF-12 and re-rupture. Assessors were blinded. Intention-to-treat and Compliance Average Causal effects (CACE) analyses were carried out. Consistency of effects across subgroups age, BMI, smoking and gender were assessed using Forest plots. Pearson's correlation was used to explore ATRS correlation with blood and growth factors.

Results: 216/230 (94%) participants completed the 6-months follow-up were contacted. 182/216 (84%) completed the two-year follow-up. Participants were aged mean 46 (SD 13.0), 57 female/159 male. 96% received the allocated intervention. Two-years ATRS scores were 82.2 (SD 18.3) in the PRP group (n=85) and 83.8 (SD 16.0) in the placebo group (n=92). There was no evidence of a difference in the two-years ATRS (adjusted-mean difference -0.752 95%CI -5.523 to 4.020, p=0.757), or in any secondary outcome, and no re-rupture between at two-years. Neither PRP cellular or growth factors correlated with the two-year ATRS.

Conclusion: PRP did not improve patient-reported function or quality of life two-years after acute Achilles tendon rupture, compared with placebo, indicating that PRP offers no patient benefit in the longer term.

FP4

Is Internal Brace Augmentation (IBA) better than isolated Modified Brostrom Gould (MBG) repair for chronic lateral ligament injury: a retrospective analysis

M. Sethi¹, R. Limaye¹, N. Limaye¹

¹University Hospital of North Tees and Hartlepool, Orthopedics, Stockton-on-Tees, United Kingdom

Introduction: Acute ankle injuries are commonly seen in musculoskeletal practice. Surgical management is the gold standard for lateral ligament injury in those with failed conservative treatment for a minimum of six months. Several studies have shown good functional outcome and early rehabilitation after MBG repair with an internal brace augmentation which is a braided ultrahigh molecular weight polyethylene ligament used to enhance the repair that acts as a secondary stabiliser. Hence the aim of the study was to compare the results with and without augmentation.

Methods: A single centre retrospective review conducted between November 2017 and October 2019 and this included 172 patients with symptomatic chronic lateral ligament instability with failed conservative management. The diagnosis was confirmed by MRI. All patients had an ankle arthroscopy followed by open ligament repair. Patients were grouped into isolated MBG and internal brace groups for analyses and all had dedicated rehabilitation.

Results: A total of 148 patients were available for final follow up with 87 patients in the MBG group and 61 patients in the IBA group. Mean Age was 38 years and mean follow up was 22 months. The internal brace group showed better Manchester Oxford foot and ankle score (19.7 vs 18.2) and more patients returning to preinjury activity levels (73 vs 55) as compared to isolated repair.

Conclusion: Internal brace augmentation with MBG repair facilitated early rehabilitation and return to pre injury activity level in majority of patients compared to isolated MBG repair.

Effect of fibula shortening on medial clear space and lateral translation of the talus: an anatomical cadaveric study

A. Gomaa¹, N. Heeran¹, L. Roper¹, G. Airey², R. Gangadharan², L. Mason^{2,3}, A. Bond¹
¹University of Liverpool, Human Anatomy and Resource Department, Liverpool, United Kingdom,
²Liverpool University Hospital NHS Foundation Trust, Liverpool Orthopaedic and Trauma Service, Liverpool, United Kingdom,
³University of Liverpool, Institute of Life Course and Medical Sciences, Liverpool, United Kingdom

Introduction: Fibula shortening with an intact anterior tibiofibular ligament (ATFL) and medial ligament instability causes lateral translation of the talus. Our hypothesis was that the interaction of the AITFL tubercle of the fibular with the tibial incisura would propagate lateral translation due to the size differential.

Aim: To assess what degree of shortening of the fibular would cause the lateral translation of the talus.

Methodology: Twelve cadaveric ankle specimens were dissected removing all soft tissue except for ligaments. They were fixed on a specially-designed platform within an augmented ankle cage allowing tibial fixation and free movement of the talus. The fibula was progressively shortened in 5mm increments until complete ankle dislocation. The medial clear space was measured with each increment of shortening.

Results: The larger AITFL tubercle interaction with the smaller tibial incisura caused a significant increase in lateral translation of the talus. This occurred in most ankles between 5-10mm of fibular shortening. The medial clear space widened following 5mm of shortening in 5 specimens (mean=2.0725, SD=±2.5338). All 12 specimens experienced widening by 10mm fibula shortening (Mean=7.2133mm, SD=±2.2061). All specimens reached complete dislocation by 35mm fibula shortening. Results of ANOVA analysis found the data statistically significant (p<0.0001).

Conclusion: This study shows that shortening of the fibula causes a significant lateral translation of the talus provided the ATFL remains intact. Furthermore, the interaction of the fibula notch with the ATFL tubercle of the tibia appears to cause a disproportionate widening of the medial clear space due to its differential in size. Knowledge of the extent of fibula shortening can guide further intervention when presented with a patient experiencing medial clear space widening following treatment of an ankle fracture.

HARnT-2 hindfoot nail or pro-tibial screw fixation for early mobilisation: multi-centre comparative study of utilisation & outcomes in complex ankle fractures

J. Bethel¹, A.-A. Najefi¹, M. Davies¹, E. Gosney¹, K. Patel¹, R. Ahluwalia¹
¹King’s College Hospital, London, Orthopaedics, London, United Kingdom

Introduction: Hindfoot intramedullary nail fixation (HFN) or fibula pro-tibial screw fixation (PTS) are surgical options for ankle fractures in patients with multiple co-morbidities; we compared their outcomes.

Methods: A retrospective review of 135 patients who underwent HFN fixation (87 patients) or PTS fixation (48 patients) for ankle fractures (AO/OTA A/B/C) from 5 major trauma centres. Patient demographic data, co-morbidities, Charlson Co-morbidity Index Score (CCIS), weight-bearing, and post-operative complications were recorded. Radiographs were assessed for non-union and anatomical reduction.

Results: HFN estimated 10-year survival was 27±31% and was 48±37% for PTS (p<0.001). Average time to full weightbearing (FWB) in the HFN group was 1.7±3.3 weeks compared to 7.8±3.8 weeks in the PTS group (p<0.001). Despite this, HFN fixation carried a greater VTE risk (p=0.02). HFN accompanied by joint preparation had greater risk of infection (p=0.01), metalwork failure (p=0.02) and wound breakdown (p=0.01). The overall complication rate in diabetic patients was 56%, but 76% in HFN patients. In the HFN group 17 (20%) patients died at 1 year. Patients with open fractures(p=0.01), dementia (p<0.05), and a higher CCIS (p=0.04) were more likely to die after HFN surgery. Age and co-morbidity matched data showed a higher rate of complications and mortality in those above 75 years fixed with a HFN, irrespective of CCIS. In those between 60-75 years, there was a greater risk of superficial infection and mortality after HFN, irrespective of CCIS. These complications were not seen after PTS.

Conclusion: HFN carries a greater risk of superficial infections, VTE and mortality compared to PTS, independent of age and CCIS. Diabetes leads to a greater comparative risk of deep infections, wound breakdown and non-union in HFN. Alternative methods of fixation (e.g. PTS) should be considered before HFN. HFN may be suitable in selective indications where other methods are not appropriate.

The acute management of pilon fractures (ENFORCE) study: a trainee led national collaborative evaluation of practice

D. Hill¹, J. Davis¹
¹Torbay and South Devon NHS Foundation Trust, Trauma and Orthopaedic Surgery, Torquay, United Kingdom

Introduction: Tibial Pilon fractures are potentially limb threatening, yet standards of care are lacking from BOFAS and the BOA. The mantra of “span, scan, plan” describes staged management with external fixation to allow soft tissue resuscitation, followed by a planning CT-scan. Our aim was to evaluate how Tibial Pilon fractures are acutely managed.

Methods: ENFORCE was a multi-centre retrospective observational study of the acute management of partial and complete articular Tibial Pilon fractures over a three-year period. Mechanism, imaging, fracture classification, time to fracture reduction and cast, and soft tissue damage control details were determined.

Results: 656 patients (670 fractures) across 27 centres were reported. AO fracture classifications were: partial articular (n=294) and complete articular (n=376). Initial diagnostic imaging mobilities were: plain radiographs (n=602) and CT-scan (n=54), with all but 38 cases having a planning CT-scan. 526 fractures had a cast applied in the Emergency Department (91 before radiological diagnosis), with the times taken to obtain post cast imaging being: mean 2.7 hours, median 2.3 hours, range 28 mins – 14 hours). 35% (102/294) of partial articular and 57% (216/376) of complete articular (length unstable) fractures had an external fixator applied, all of which underwent a planning CT-scan. Definitive management consisted of: open reduction internal fixation (n=495), fine wire frame (n=86), spanning external fixator (n=25), intramedullary nail (n=25), other (n=18).

Conclusion: The management of Tibial Pilon fractures is variable, with prolonged delays in obtaining post cast reduction radiographs, and just over half of length unstable complete articular fractures being managed with the gold standard “span, scan, plan” staged soft tissue resuscitation. A BOFAS endorsed BOAST (British Orthopaedic Association Standard for Trauma) for Tibial Pilon fractures is suggested for standardisation of the acute management of these potentially limb threatening injuries, together with setting them apart from more straightforward ankle fractures.

Lateral column midfoot injury. Do they all need fixation?

G. Airey¹, J. Aamir^{1,2}, J. Chapman^{1,2}, H. Tanaka³, M. Elbannan³, A. Singh¹, J. Mangwani⁴, H. Kyaw⁴, L. Jeyaseelan⁵, L. Mason^{1,2}
¹Liverpool University Hospital NHS Foundation Trust, Liverpool Orthopaedic and Trauma Service, Liverpool, United Kingdom,
²University of Liverpool, Institute of Life Course and Medical Sciences, Liverpool, United Kingdom,
³Aneurin Bevan University Health Board, Newport, United Kingdom,
⁴Leicester Hospitals NHS Foundation Trust, Leicester, United Kingdom,
⁵Barts Health NHS Foundation Trust, London, United Kingdom

Background: Research on midfoot injuries have primarily concentrated on the central column and the Lisfranc ligament without amassing evidence on lateral column injuries. Lateral column injuries have historically been treated with Kirschner wire fixation when encountered.

Objective: Our aim in this study was to analyse lateral column injuries to the midfoot, their method of treatment and the radiological lateral column outcomes. Our nul hypothesis being that fixation is required to obtain and maintain lateral column alignment.

Methods: Data was retrospectively collected from four centres on surgically treated midfoot fracture dislocations between 2011 and 2021. Radiographs were analysed using departmental PACS. All statistics was performed using SPSS 26.

Results: A total of 235 cases were diagnosed as having a lateral column injury out of the 409 cases included. On cross tabulation, there was a significant association with having a central column injury (234/235, p<.001) and 70% of cases (166/235) also had an additional medial column injury.

Of the 235 lateral column injuries, data was available regarding fixation radiographic alignment on 222 cases. There were 44 cases which underwent Kirschner wire fixation, 23 plate fixations and 3 screw fixations. Lateral column alignment loss was seen in 2.84% (4/141) of those which didn’t undergo fixation, 13.64% (6/44) which underwent K wires, and 0 % in those fixed by screws or K wires.

Conclusion: Lateral column injury occurs in over half of midfoot fractures in this study. It rarely occurs alone and is most commonly related to three column injuries. Nevertheless, following stabilisation of the central column, additional fixation of injuries to the lateral column do not appear beneficial. The use of a bridge plate to fix the central column appears protective and purely ligamentous injury was a higher risk than an injury that included the bone.

Long term follow-up of complex calcaneal osteomyelitis treated with modified Gaenslen approach

A. Kendal¹, B. Down¹, C. Loizou¹, M. McNally¹

¹Nuffield Orthopaedic Centre, Oxford, United Kingdom

Background: The treatment of chronic calcaneal osteomyelitis is a challenging and increasing problem because of the high prevalence of diabetes mellitus and operative fixation of heel fractures. In 1931, Gaenslen reported treatment of hematogenous calcaneal osteomyelitis by surgical excision through a midline, sagittal plantar incision. We have refined this approach to allow successful healing and early mobilization in a modern series of complex patients with hematogenous, diabetic, and postsurgical osteomyelitis.

Methods: Twenty-eight patients (mean age 54.6 years, range 20-94) with Cierny-Mader stage IIIB chronic osteomyelitis were treated with sagittal incision and calcaneal osteotomy, excision of infected bone, and wound closure. All patients received antibiotics for at least 6 weeks, and bone defects were filled with an antibiotic carrier in 20 patients. Patients were followed for a mean of 31 months (SD 25.4). Primary outcome measures were recurrence of calcaneal osteomyelitis and below-knee amputation. Secondary outcome measures included 30-day postoperative mortality and complications, duration of postoperative inpatient stay, footwear adaptations, mobility, and use of walking aids.

Results: All 28 patients had failed previous medical and surgical treatment. Eighteen patients (64%) had significant comorbidities. The commonest causes of infection were diabetes ± ulceration (11 patients), fracture-related infection (4 patients), pressure ulceration, hematogenous spread, and penetrating soft tissue trauma. The overall recurrence rate of calcaneal osteomyelitis was 18% (5 patients) over the follow-up period, of which 2 patients (7%) required a below-knee amputation. Eighteen patients (64%) had a foot that comfortably fitted into a normal shoe with a custom insole. A further 6 patients (21%) required a custom-made shoe, and only 3 patients required a custom-made boot.

Conclusion: Our results show that a repurposed Gaenslen calcanectomy is simple, safe, and effective in treating this difficult condition in a patient group with significant local and systemic comorbidities.

FREE PAPER SESSION 2
Thursday 9th March 2023

What do BOFAS members perceive to be the barriers and facilitators of day-case surgery for major foot and ankle procedures? A scoping survey of surgeons

L. Houchen-Wolloff¹, A. Berry², N. Crane¹, D. Townsend³, R. Clayton⁴, J. Mangwani¹

¹University Hospitals of Leicester NHS Trust, Leicester, United Kingdom,

²Spire Hospital, Leicester, United Kingdom,

³Northumbria Healthcare NHS Foundation Trust, Tyneside, United Kingdom,

⁴Victoria Hospital, Kirkcaldy, United Kingdom

Introduction: Recent advances in minimally invasive surgery and improved post-operative pain management make it possible to perform major foot/ankle operations as day-case. This could have significant impact on length of stay, saving resources and is in keeping with government policy. However, there are theoretical concerns about complications and low patient satisfaction due to pain.

Methods: The survey was developed following review of the literature and was approved for distribution by the BOFAS (British Orthopaedic Foot & Ankle Society) scientific committee. An online survey (19 questions) was sent to UK foot and ankle surgeons via the BOFAS membership list. Major foot/ ankle procedures were defined as surgery that is usually performed as an inpatient in majority of centres and day-case as same day discharge, with day surgery as the intended pathway.

Results: A total of 132 surgeons responded, 80% from Acute NHS Trusts. The majority (78%) thought that more procedures could be performed as day-case at their centre. Currently 45% of respondents perform less than 100 day-case surgeries per year for these procedures. Despite post-operative pain and patient satisfaction being theoretical concerns for day-case surgery in this population; these outcomes were only measured by 34% and 10% of respondents respectively. The top perceived barriers to performing more major foot and ankle procedures as day-case were: Lack of physiotherapy input pre/post-operatively (23%), Lack of out of hours support (21%).

Conclusions: There is consensus among surgeons to do more major foot/ ankle procedures as day-case. Despite theoretical concerns about post-operative pain and satisfaction this was only measured by a third of those surveyed. Out of hours support and physiotherapy input pre/ post-op were perceived as the main barriers. There is a need to scope the provision of physiotherapy pre/post-operatively and out of hours support at sites where this is a perceived barrier.

Towards understanding Müller-Weiss disease: a universal platform

J. Wong-Chung¹, R. McKenna², M. Lynch-Wong¹, A. Walls¹, A. Wilson³

¹Altnagelvin Hospital, Trauma and Orthopaedic Surgery, Londonderry, United Kingdom,

²Musgrave Park Hospital, Trauma and Orthopaedic Surgery, Belfast, United Kingdom,

³Musgrave Park Hospital, Trauma and Orthopaedics, Belfast, United Kingdom

Background: The only existing classification of Müller-Weiss Disease (MWD), based solely on Méary’s angle, serves neither as guide for prognosis nor treatment. This accounts for lack of gold standard in its management.

Methods: Navicular compression, medial extrusion, Kite’s angle and metatarsal lengths were measured on all radiographs of 95 feet with MWD. Joints involved, presence and location of navicular fracture were recorded.

Results: We identified three distinct groups.

Group 1 comprises 11 “early-onset” MWD feet, aged 9 to 29 years. These had the greatest compression and medial extrusion, and lowest Kite’s angles. All except 1 were index minus and had a lateral navicular fracture. None has required surgery to date. Only 1 has moderate talonavicular joint (TNJ) degeneration.

Group 2 comprises 23 “Müller-Weissoid” feet with radiologically normal navicular in their fifties and developing MWD, on average, 4.5 years later. These had the lowest compression and extrusion, and highest Kite’s angles. None had complete fracture. All had TNJ arthritis, with early changes at lateral naviculocuneiform joint (NCJ) in 43%.

Group 3 “late-onset” MWD, presenting in the sixth decade, is subdivided into 3 sub-groups. Only TNJ is involved in group 3A (16). Group 3B denotes affection of TNJ more than NCJ (20). In group 3C “reverse Müller-Weiss disease”, which affects NCJ more than TNJ (25), second metatarsal overlength is highest of all groups. No difference in age, compression, extrusion and Kite’s angle exists among the 3 subgroups. No fracture occurred in group 3A compared to 65% and 32% in groups 3B and 3C, respectively.

Conclusions: With a need to compare like-for-like pathology, the proposed classification provides a common platform for reporting outcomes of different treatment modalities, operative or nonoperative. We theorize pathogenetic pathways in the different groups and propose systematic surgical approaches for each category.

Outcomes of tenosynovial giant cell tumour of the foot & ankle

J. Barnett¹, B. Rudran¹, S. Patel¹, W. Aston¹, M. Welck¹, N. Cullen¹

¹Royal National Orthopaedic Hospital, Foot & Ankle Unit, London, United Kingdom

Background: Tenosynovial giant cell tumour (TGCT) is a benign proliferative disease affecting synovial membranes. There are two forms, localised and diffuse, which although histologically similar are managed differently. It is locally invasive and is treated in most cases by operative excision. The aim of this study was to assess outcomes from the largest single-centre experience to date in patients with this condition.

Methods: A retrospective analysis of 123 cases was performed in patients treated between 2003 and 2019 with TGCT of the foot and/or ankle. Data was collected on age at presentation, radiological pattern of disease, location of disease, treatment provided and recurrence rates. The minimum follow-up was 2 years with a mean of 7.7 years.

Results: 47 male and 76 female patients with a mean age at diagnosis of 39 (range, 11-76) years were identified. 85 (69.1%) cases were categorised as localised and 38 (30.9%) were diffuse. Half of the cases presented in the ankle (62/123, 50.4%). 89% (110) of patients underwent open operative excision of the lesion. Radiotherapy was used in 2 cases for recurrent disease. Pain was the most common postoperative symptom which developed in 20% (22/110) of cases). 13 cases were managed nonoperatively where symptoms were minimal, with one case requiring surgery at a later date. Disease recurrence was 3.5% (3/85) in localised disease and 36.8% (14/38) in diffuse disease giving an overall recurrence rate of 13.8% (17/123).

Conclusion: The outcomes of TGCT management are dependent on the type of disease, the extent of preoperative erosive changes and the presence of pre-operative pain. We present a summary of recommended management based on the experience from this single tertiary centre.

FP13

The importance of anatomical Charcot reconstruction utilising standardised osteotomies to improve surgical outcomes

P. Kosa¹, R. Ahluwalia¹, I. Reichert¹
¹Kings College Hospital, Department of Orthopaedics and Micheal Edmonds Diabetic Foot Unit, London, United Kingdom

Introduction: Charcot neuroarthropathy is a debilitating condition that frequently leads to skeletal instability, and has an increased risk of ulceration leading to infection and amputation. However, surgical reconstruction may offer limb salvage and restauration of an ulcer-free, plantigrade stable foot for functional weight-bearing. We report on our case series according to a prospective protocol and analyse factors leading to a favourable outcome.

Methods: We report a prospective follow-up of 62 patients undergoing Charcot reconstruction, May 2014- Jan 2022, by two surgeons. Peripheral vascular disease was routinely assessed using Duplex scan and major arterial disease was treated before reconstruction. Utilising 3D modelling, pre-operative planning and standardised osteotomies, we performed anatomical correction with radiological evidence. Definitive fixation was undertaken with internal fixation to stabilise the hindfoot. Multivariant analysis was performed to assess risk factors for failure (P>0.05 statistical significance).

Results: 59 feet were included, 3 patients did not progress to definitive surgery and 3 patients had bilateral surgery. 62.7% patients were male with an average age of 56, 88.13% had Type 2 diabetes, 56% were hypertensive, 14% were on dialysis. Twenty (54.1%) single stage reconstructions had pre-operative ulceration, 3 pts had ischaemic heart disease and 36 pts had evidence of peripheral arterial disease.

81% of patients achieved normalisation of the 3 out of 4 anatomical angles (P<0.05). Two patients (3.1%) required metalwork removal for infection and limb salvage, 11 (18.6%) had delayed wound healing. Survivorship was 97% at 3yrs, and 94% at 6yrs, however if pre-existing vascular disease was present, it was 94% at 3yrs 85.3% at 6yrs. All patients were mobile at a 3 years mean follow up.

Conclusion: Careful patient selection, multidisciplinary team and anatomic reconstruction led to predictable outcomes and functional limb salvage. Pre-operative vascular compromise led to a slight reduction in survivorship, but no major amputation.

FP14

Neglected and relapsed clubfoot in adults, the functional outcome of acute surgical correction
S. Nogdallah¹, M. Fatooh¹, A. Khairy², H. Mohamed¹, A. Abdulrahman², H. Mohamed²
¹Alneelain University, Orthopaedics and Trauma, Khartoum, Sudan,
²Bashaer University Hospital, Orthopaedics and Trauma, Khartoum, Sudan

Background: Neglected clubfoot in this series is defined as untreated equino-cavo-adducto-varus in older children, or adults. Relapsed clubfoot is the residual deformity that remains after single or multiple surgical interventions. Severe neglected clubfoot rarely exists today in developed countries, except in some emigrants from low- and middle-income countries. Acute surgical management with corrective mid-foot osteotomy and elongation of the Achilles tendon has excellent functional outcome.

Objective: To assess the functional outcome of acute correction of neglected Talipes-quino-varus deformity in adults.

Methods: This is cross sectional, hospital-based study that took place in Khartoum, Sudan. Forty patients were included in this study. Midfoot osteotomy and elongation of the Achilles tendon were performed to all patients. Data was collected using a questionnaire and the functional outcome has been assessed using the American Orthopaedic Foot and Ankle Society Score (AOFAS). This score was measured before surgery and one years after surgery.

Results: The mean age was 19.9±4.7 years. Males were 25 (62.5%) and females were 15 (37.5%). The mean preoperative AOFAS score was 37.7±7.1 (poor). This score improved to 80.7±13.7 (good to excellent), two years after surgery. However, this indicates significant change in the functional outcome after the operation (P value < 0.05). Excellent post-operative functional outcome was found among patients aged 18 – 23 years 18 (50%) P. value: 0.021. The majority of patients 36(90%) were fully satisfied with the operation, 2(5%) partially satisfied and 2(5%) were unsatisfied.

Conclusion: Acute correction of neglected and relapsed TEV with elongation of the Achilles tendon and single midfoot osteotomy has excellent functional outcome as assessed by AOFAS Score. The satisfaction with this procedure is impressive. The younger age population showed better outcomes with this procedure.

Structural validation of the Manchester-Oxford Foot Questionnaire (MOxFQ) for use in foot and ankle surgery

R. Goodall¹, K. Borsky², C. Harrison³, M. Welck⁴, K. Malhotra⁴, J. Rodrigues⁵
¹Imperial College London, Surgery and Cancer, London, United Kingdom,
²Department of Plastic Surgery, Salisbury Foundation NHS Trust, UK, Salisbury, United Kingdom,
³Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, University of Oxford, UK, Oxford, United Kingdom,
⁴The Royal National Orthopaedic Hospital, London, UK, London, United Kingdom,
⁵Warwick Clinical Trials Unit, University of Warwick, UK, Warwick, United Kingdom

Background: The Manchester-Oxford Foot Questionnaire (MOxFQ) is a condition specific patient reported outcome measure (PROM) for foot and ankle surgery. It consists of 16 items across three subscales measuring distinct, but related traits: walking/standing ability, pain, and social interaction. Although it is the most used foot and ankle PROM in the UK, initial MOxFQ validation involved analysis of only 100 individuals undergoing hallux valgus surgery. This project aimed to establish whether an individual’s response to the MOxFQ varies with anatomical region of disease (measurement invariance), and to explore structural validity of the factor structure (subscale items) of the MOxFQ.

Methods: This was a single-centre, prospective cohort study involving 6640 patients (mean age 52, range 10-90 years) presenting with a wide range of foot and ankle pathologies between 2013 and 2021. Firstly, to assess whether the MOxFQ responses vary by anatomical region of foot and ankle disease, we performed multi-group confirmatory factor analysis. Secondly, to assess the structural validity of the subscale items, exploratory and confirmatory factor analyses were performed.

Results: Measurement invariance by pathology was confirmed suggesting the same model can be used across all foot and ankle anatomical regions. Exploratory factor analysis demonstrated a 2-3 factor model, and suggested that item 13 (inability to carry out my work/everyday activities) and item 14 (inability to undertake social/recreational activities) loaded more positively onto the walking/standing subscale than their original social interaction subscale.

Conclusions: This large-cohort study supports the current widespread use of the MOxFQ across a broad range of foot and ankle pathologies. Items 13 and 14 might be better moved from the “social interaction” to the “walking/standing” subscale and this may have future implications for deriving/analysing subscale scores.

FP16

Clinical outcomes of autologous osteochondral transplantation for osteochondral lesions of the talus: an age-based multivariable analysis
M. Azam¹, C. Colasanti¹, J. Butler¹, M. Weiss¹, P. Brodeur², J. Kennedy¹
¹NYU Langone Health, Orthopaedics, New York, United States, ²Warren Alpert Medical School of Brown University, Providence, United States

Introduction: The purpose of this study was to examine trends in patient characteristics and clinical outcomes that occur with age as a statistical variable when performing autologous osteochondral transplantation (AOT) for the treatment of osteochondral lesions of the talus (OLT).

Methods: A retrospective cohort study for AOT procedures on 78 patients from 2006 to 2019. was conducted Clinical outcomes were evaluated via FAOS scores. A multivariable linear regression was used to assess the independent factors predictive of the first post-operative FAOS after AOT. The independent variables included pre-operative FAOS, age, defect size, shoulder lesion, cystic lesion, prior traumatic injury, and history of microfracture surgery. A p-value <.05 was considered significant and 95% confidence limits (95% CL) for regression coefficient estimates (est.) were calculated.

Results: 78 patients were included with a mean age of 35.5 ± 13.6years at a mean follow-up was 54.4 ± 18.9 months. The mean pre-operative FAOS was 54.3 ± 19.4 and the mean post-operative FAOS was 83.4 ± 13.6. The mean defect size was 109.3±62.4 mm2. The multivariable linear regression showed that the pre-operative FAOS was associated with a higher post-operative FAOS (est., 95% CL: 0.16, 0.012 - 0.307; p=0.034). Defect size (est., 95% CL: -0.05, -0.097 - -0.003; p=0.0358), having a shoulder lesion (est., 95% CL: -9.068, -15.448 - -2.688; p=0.006), or having a prior microfracture surgery (est., 95% CL: -7.07, -13.118 - -1.021; p=0.0226) were associated with a lower post-operative FAOS.

Conclusion: Patient age was not an independent risk factor for inferior clinical outcomes after AOT for OLT. Additionally, cystic lesions, or lesions with a traumatic aetiology were not significantly associated with post-operative FAOS. Having a shoulder lesion had the largest marginal effect on post-operative FAOS. These findings provide important information for providers when counseling and selecting patients for AOT procedure for treatment of OLT.

The 10-year patient-reported and clinical outcomes of a series of 156 mobile-bearing total ankle replacements and the effects of patient age

A. Porter¹, A. Pujol Nicolas¹, S. Hakeem¹, N. Abdul¹, D. Elamin¹, M. Douglas-Harris¹, J. Ramaskandhan¹, M. Siddique¹

¹Freeman Hospital, MSK, Newcastle upon Tyne, United Kingdom

Background: Total Ankle Replacement (TAR) is an established treatment option for end-stage ankle arthritis. We analysed at minimum,10-year patient-reported and clinical outcomes of 156 TARs from a single centre. We specifically compared outcomes between patients under 60 and over 60 at time of surgery.

Methods: Data was collected retrospectively from our departmental patient database. It included all patients who underwent a TAR by a single surgeon between 2006 and 2010 and patients were divided into those under 60 and those over 60 at the time of surgery. Patient reported outcomes (PROMs), including WOMAC, SF-36 and patient satisfaction scores and complications were analysed preoperatively and at one, two, five and over 10 years postoperatively.

Results: There were 156 patients included in this analysis, 61 were under 60 (mean age 50.29) and 95 were over 60 (mean age 69.12). A total of 12 patients had revision surgery, (nine in the under 60 group) and 52 patients were deceased at the time of analysis (10 in the under 60 group). At one year the over 60 group had less pain and better functional scores (p=0.02, p=0.017). At two, five and ten years there was no statistical difference in pain and function between groups. At two years the over 60s reported less stiffness and quicker return to activities of daily living (p=0.007, p=0.001). However, at five and 10 years there was no statistical difference in any domain.

Conclusions: This study demonstrates that age does not correlate with a significant difference in pain or functional outcomes in patients who have TAR, at over 10 years follow up. The higher revision rates in the younger group may correlate with higher functional demand and lower mortality rate.

Metal debris release may be under-recognised in total ankle replacement

S. Haston¹, D. Langton², D. Townshend³, R. Bhalekar², T. Joyce¹

¹Newcastle University, School of Engineering, Newcastle upon Tyne, United Kingdom,

²ExplantLab, Newcastle upon Tyne, United Kingdom,

³Northumbria NHS Trust, North Shields, United Kingdom

Despite advancements, revision rates following total ankle replacement (TAR) are high in comparison to other total joint replacements. This explant analysis study aimed to investigate whether there was appreciable metal particulate debris release from various contemporary TARs by describing patterns of material loss.

Twenty-eight explanted TARs (9 designs: 3 fixed and 6 mobile bearing), revised for any reason, were studied. The articulating surfaces of the metal tibial and talar components as well as the polyethylene insert were assessed for damage features using light microscopy. Based on the results of the microscopic analysis, scanning electron microscopy with energy dispersive X-ray spectroscopy was performed to determine the composition of embedded debris identified, as well as non-contacting 3D profilometry.

Pitting, indicative of material loss, was identified on the articulating surfaces of 54% of tibial components and 96% of talar components. Bearing constraint was not found to be a factor, with similar proportions of fixed and mobile bearing metal components showing pitting. More cobalt-chromium than titanium alloy tibial components exhibited pitting (63% versus 20%). Significantly higher average surface roughness (Sa) values were measured for pitted areas in comparison to unpitted areas of these metal components (p<0.05). Additionally, metallic embedded debris (cobalt-chromium likely due to pitting of the tibial and talar components or titanium likely from loss of their porous coatings) was identified in 18% of polyethylene inserts. The presence of hard 3rd body particles was also indicated by macroscopically visible sliding plane scratching, identified on 79% of talar components.

This explant analysis study demonstrates that metal debris is released from the articulating surfaces and the coatings of various contemporary TARs, both fixed and mobile bearing. These findings suggest that metal debris release in TARs may be an under-recognised issue that should be considered in the study of painful or failed TAR moving forwards.

A comparison of functional outcome scores for primary and revision ankle replacements

A. Moriarity¹, M. Raglan¹, S. Dhar¹

¹Nottingham University, Orthopaedics - Foot and Ankle, Nottingham, United Kingdom

Background: Patients who undergo either primary or revision total ankle replacement (TAR) expect improvements in pain, function and quality of life. The goal of this study was to measure the functional outcome improvements and the difference in patient-reported outcomes in patients undergoing primary total ankle replacements compared to revision TAR.

Methods: A single-center prospective cohort study was undertaken between 2016 and 2022. All patients were followed up for a minimum of 6 months. Patients undertook the Manchester Oxford Foot Questionnaire (MoxFQ) and EQ-5D health quality questionnaires pre-operatively, at 6 months and yearly for life. The Mann Whitney test was undertaken for statistical analysis.

Results: A total of 165 primary and 71 revision ankle replacements were performed between 2016 and 2022. The mean age was 71 years for primary replacements and 69 years for revisions. The INFINITY was utilized in the majority of primary total ankle replacements. Revision replacements were either the INBONE II or INVISION and they were most often revising the MOBILITY implant. The main indication for revision was aseptic loosening (83%). Other causes included infection, malalignment and insert wear. The overall MoxFQ improved by a mean of 46.5 for primaries and 40.2 for revisions. The EQ-5D score also showed overall improvements with the mean difference in mobility increasing by 1.6.

Conclusion: Both primary and revision ankle replacements result in improved functional scores at 6 months, 1 year and 2 years. In this cohort with the implants used, both primary and revision ankle replacements demonstrate similar improvements in functional scores.

Level of evidence: Level II, prospective cohort study.

Survival of revision ankle replacements after a failed primary ankle replacement: a data linkage study using the National Joint Registry and NHS Digital

T. Jennison¹, I. Sharpe², A. Goldberg³

¹Plymouth Hospitals NHS Trust, Plymouth, United Kingdom,

²Royal Devon and Exeter NHS Trust, Exeter, United Kingdom,

³Wellington Hospital, London, United Kingdom

Introduction: The number of revision ankle replacements is increasing. There are limited numbers of publications on survivorship.

The primary objective was to analyse the survival of revision ankle replacements using a large dataset from the National Joint Registry. Secondary aims were to summarise patient demographics, indications, further operations and predictors of survival.

Methods: A data linkage study combined National Joint Registry (NJR) Data and NHS Digital data. The primary outcome of failure is defined as a revision fusion procedure, conversion to ankle replacement or amputation. Life tables and Kaplan Meier survival charts were used to illustrate survivorship. Cox proportional hazards regression models were fitted to compare failure rates.

Results: 228 patients underwent revision ankle replacement. The mean follow-up was 2.6 years The mean time from primary to revision was 2.3 years. 77.2% were for aseptic causes. 56.6% of implants were the Inbone ankle replacement.

29 (12.7%) failed. 9 underwent a further revision, 19 conversion to fusion and 1

The 1-year survivorship was 95.4% (95% CI 91.6% to 97.5%), 3-year survivorship in 124 was 87.7% (95% CI 81.9% to 91.7%), and the 5-year survivorship in 57 was 77.5% (95% CI 66.9%-85.0%). Revision specific implants has better survivorship than primary implants used for revisions. In total 50 (21.9%) patients had further surgery of which 19 (8.3%) underwent re-operations in the first 12 months.

Cox regression models were undertaken. In crude analysis the only significant risk factors for failure were the use of cement (HR 3.02, 95% CI 0.65-1.25) and time since primary ankle replacement (HR 0.67, 95% CI 0.47-0.97). In multivariable Cox regression modelling no risk factors for failure were identified

Conclusion: Revision ankle replacements have good medium term survivorship and low rates of further surgery. New modular revision implants appear to have improved survivorship compared to traditional ankle replacement implants.

FP21

Long term follow up, re-operations and patient reported outcomes following revision surgery for failed total ankle replacements

A. Somanathan¹, B. Sharp², F. Saedi², C. Loizou², R. Brown², A. Kendal²

¹University of Oxford, Oxford, United Kingdom,

²Nuffield Orthopaedic Centre, Oxford, United Kingdom

Introduction: Primary ankle arthroplasty (TAR) is increasingly used to treat end-stage ankle arthritis. Reported revision rates of TAR vary from 8.5% to 11.1% at 9 years. Revision surgery remains technically challenging with options ranging from simple joint debridement to tibio-talar-calcaneal fusion. The efficacy of these procedures remains unclear and there is no consensus on optimal revision options.

Methods: A retrospective cohort study was performed of all patients undergoing surgery for a failed primary TAR at the Nuffield Orthopaedic Centre (2004-2021). TAR failure was determined by clinical assessment, serial radiographs and CT scans. Primary outcome measures included type and time of index surgery post TAR. Secondary outcomes included frequency of re-operations, post-operative complications, patient reported outcomes and union rate (for revision arthrodesis procedures).

Results: 70 failed TARs in 69 patients (35M:34F, mean 65.7 years, s.d.=11.6) underwent re-operation a mean of 6.24 years (range 1-30) post primary. In total, 107 operations were performed including revision fusion (n=50), revision arthroplasty (n=14), bearing exchange (n=9) and joint clearance (n=9). The overall revision fusion union rate was 73.5% over a mean of 12.5 months (s.d.=7.6). 16/23 (69.6%) Tibio-Talo-Calcaneal and 9/12 (75%) ankle fusions (previous subtalar/triple fusion) using a hindfoot nail united over a mean 11.4 months (s.d.=6.0) and 15 months (s.d.=9.48) respectively. Only 64% of ankle fusions using screws alone united (mean=10.6 months, s.d.=8.14). The average post-operative MOXFQ score was 28.3 (s.d.=19.3). 73% said the operation improved their function and would recommend it to a friend/family member.

Conclusion: Despite low post-operative MOXFQ scores, over 70% of patients were satisfied with re-operation for a failed TAR. Over 26% of all TAR revision fusions fail to unite with the highest non-union rates observed post ankle arthrodesis with screws alone (36.4%).

FP22

Salvage ankle fusion after a failed primary ankle replacement - a data linkage study using the National Joint Registry and NHS Digital

T. Jennison¹, A. Goldberg², I. Sharpe³

¹Plymouth Hospitals NHS Trust, Plymouth, United Kingdom,

²Wellington Hospital, London, United Kingdom,

³Royal Devon and Exeter NHS Trust, Exeter, United Kingdom

Introduction: When a total ankle replacement fails it can be converted to an ankle fusion or a revision ankle replacement. Despite the increased numbers of undertaken there is limited research on the management of patients undergoing a conversion to fusion following a failed ankle replacement.

The primary aim of this study was to analyse the survival of ankle fusions following a failed ankle replacement using a large dataset from the National Joint Registry.

Methods: A data linkage study combined National Joint Registry (NJR) Data and NHS Digital data. The primary outcome of failure is defined as a revision fusion procedure, conversion to ankle replacement or amputation. Life tables and Kaplan Meier survival charts were used to illustrate survivorship. Cox proportional hazards regression models were fitted to compare failure rates.

Results: 131 underwent conversion to fusion as a salvage procedure. The mean age was 65.7 and 55.7% were males. The mean follow-up was 47.5 months. The mean time from primary ankle replacement to revision to an ankle fusion was 5.3 years. 50 (38.2%) patients required further surgery. Of the 131 patients, 32 patients (24.0%) underwent reoperations other than revision and 29 (22.1%) required revision. 24 (18.3%) underwent re-revision to another fusion and 5 (3.8%) underwent a below-knee amputation. No cases were converted back to a TAR. Failure tended to occur in the first three years with 1-year survival of salvage ankle fusion in 131 patients being 96.0% (95% CI 90.7 to 98.3) and 3-year survival in 69 patients being 77.5% (95% CI: 68.3 to 84.4).

Conclusion: Salvage ankle fusion after a failed ankle replacement demonstrates high rates of failure and re-operations. 38.2% of patients undergo further surgery and 23% require revision within 3 years. Further studies are required to further analyse the outcomes of failed ankle replacements.

FP23

Management of failed total ankle replacement and massive bone cysts using impaction bone grafting and the inversion total ankle replacement system

C. Gordon¹, M. Raglan¹, S. Dhar¹, K. Lee¹

¹Nottingham University Hospital NHS Trust, Orthopaedics, Nottingham, United Kingdom

Objective: The purpose of this study was to determine the outcomes of revision ankle replacements, using the Invision implant and impaction allograft for massive talar dome defects following primary ankle replacement failure. Outcomes were assessed in terms of bone graft incorporation; improvement in patient reported outcome measures (PROMs); and survivorship of the revision ankle arthroplasty.

Methods: A retrospective review of prospectively collected data identified eleven patients who had massive bone cysts and underwent revision of a failed primary total ankle replacement to the Invision revision system, combined with impaction grafting using morselized femoral head allograft. These revisions occurred at a single high volume ankle arthroplasty centre. Computed tomography (CT) scans were used to assess bone graft incorporation and the Manchester-Oxford Foot Questionnaire (MOXFQ) and EQ-5D scores were used pre and post operatively to assess PROMs.

Results: The mean follow up was 18 months (12-48months). In all eleven patients, improvement was reported in the post-operative MOXFQ and EQ-5D scores. CT scans showed bone graft incorporation in all cases. None of the patients have required further surgery and are continue to do well clinically at latest follow up.

Conclusions: In the short term, this study confirms revision ankle replacements with the Invision prosthesis and impaction with morselized femoral head allograft is a suitable revision option for primary ankle replacement failure with massive talar bone loss. Long term follow up continues of these complex patients.

Innovations for Foot and Ankle

Trauma and Elective Procedures

Nearly 50 specific Foot and Ankle plates

Wide range of Nitinol implants for Continuous Compression

Most comprehensive portfolio of cannulated compression headless screw offerings on the market¹

1. DePuy Synthes Competitor Analysis. 16th Dec 2020. Windchill # 0000286547. Research was performed (June 2019) comparing cannulated headless screw offerings among all main competitors who offer this product line. Main competitors were defined based on market report Medtech 360 Trauma Devices Market Analysis US (2018). Most comprehensive is defined as the widest range of portfolio of available cannulated headless screw diameters currently marketed.

³Royal National Orthopaedic Hospital, Foot & Ankle Unit, Stanmore, United Kingdom

Introduction: Screws generate and maintain compression against distracting forces when performing osteotomy or fusion surgery. Headless screws with opposing flank angles (OFA) between the threads of the head and shaft are purported to achieve better compression. The purpose of this study was to compare OFA designs against traditional parallel flank angle (PFA) headless screws and headed screws to determine differences in compression and pull-out resistance (POR).

Methods: In this biomechanical in-vitro study, four screw designs were compared: headless screws with OFA (Screw_A and Screw_B), headless screws with PFA (Screw_C), and headed screws (Screw_D). All screws were 4.0x50mm partially threaded cannulated screws. Screw_B had a 1.4mm shorter head length and 0.5mm narrower head thread diameter than Screw_A and Screw_C, which were similar. A custom apparatus was designed for measuring compression and POR. Osteotomies were created on synthetic bone blocks (density 0.32g/cm3) simulating cancellous bone. Screws were inserted perpendicular to osteotomies in accordance with manufacturer guidance and maximum compression recorded. Increasing distracting forces were then applied to the blocks until the screws pulled out. For each screw type, five screws were tested.

Results: There was no significant difference in maximum compression between screw designs: Screw_A=38.7N±14.2N, Screw_B=48.7N±15.6N, Screw_C=51.9N±36.4N, Screw_D=32.0N±9.2N; p=0.921. When assessing POR, all screws failed at the head-bone interface (screw heads subsided into block). Pull-out forces significantly differed between all groups: Screw_A=466N±29.0N, Screw_B=310N±22.0N, Screw_C=399N±46.0N, Screw_D=183N±12.9N; p<0.001 (ANOVA). Screw_A had the highest POR but the other OFA design (Screw_B) had significantly lower POR.

Conclusion: Screw design, whether headless (OFA or PFA) or headed did not appear to influence compression generated. However, headed screws had significantly lower POR than headless designs. Within headless designs, OFA may increase POR, but other screw head features (number / diameter of threads) had an apparently greater influence than flank angle.

P2

A guide for surgeons to orientate the ideal trans-syndesmotic fixation – a novel technique based on CT

A. Patel¹, S. Merie¹, V. Kothari¹, A. Roche¹

¹Chelsea & Westminster Hospital, Trauma & Orthopaedics, London, United Kingdom

Introduction: Correctly orientating a syndesmotic screw can be challenging particularly for inexperienced surgeons. Failures can lead to longer term morbidity therefore there is a demand for reproducible techniques to guide surgeons. Techniques reliant on leg rotation can be disorientating. We propose a technique to orientate fixation using identifiable soft tissue landmarks independent of leg rotation. This study uses cross-sectional computed tomography (CT) to validate the technique.

Methods: 40 CT scans of uninjured ankles were studied. Fixations were planned 15mm above the joint line to provide both stabilisation and ease of palpating tendon structures. Axial images were studied with entry points for the screw on the fibula extrapolated into the tibia – ideal screws bisect both tibia and fibula in the transverse plane. Entry points were measured from the lateral ridge of the fibula. Exit points were measured as both distance from the tibialis anterior tendon (D1) and tibialis posterior tendon (D2). Exit points were also calculated as a percentage of the distance from the tibialis anterior tendon to the tibialis posterior tendon using the formula (D1/(D1+D2))*100.

Results: The ideal entry point was calculated as 0.11±0.72mm posterior to the lateral ridge. The mean distance between the ideal exit point and the tibialis anterior tendon was 24.9±4.2mm. The mean distance between the ideal exit point and the tibialis posterior tendon was 26.6±4.2mm. The mean ideal exit point was calculated as 48.3±4.8% of the distance from tibialis anterior to tibialis posterior.

Discussion: This study shows via CT analysis that the ideal entry point for a syndesmosis screw is the lateral ridge of the fibula and the ideal exit point is 48.3±4.8% of the distance from the tibialis anterior tendon to the tibialis posterior tendon. This is an easily reproducible technique which is independent of leg orientation.

P3

One stop MDT foot and ankle clinic: our experience and results

P. Garg¹, A. Sott¹, P. Hamilton¹, S. Yousaf¹

¹Epsom and St Helier’s Hospital NHS Trsut, Trauma and Orthopaedics, London, United Kingdom

Introduction: Management of foot and ankle pathology often require patients to attend multiple visits to healthcare institutions for various assessments, investigations and interventions. We envisioned a “One stop foot and ankle clinic” model to offer our patients all of this in the same visit, aiming to improve patient experience whilst reducing cost to the Trust.

Methods: We set up a monthly multidisciplinary outpatient clinic with three foot and ankle consultants, a BOA fellow, a Specialist registrar, a Physiotherapist, a nurse practitioner, a Radiologist for Ultrasound diagnostics and interventions, an Orthotist and an Orthopaedic Practitioner providing Electro-shock wave therapy along with image guided injections.

We measured the service improvement by counting the additional services offered to attending patients on the same day thus reducing repeated patient attendances. We measured patient satisfaction by a special feedback form assessing their experience of the clinic. Cost savings were recorded through reduction of follow up visits, increased surgical conversion rates and decreasing DNA rates.

Result: We saw between 40 and 50 patients per event. The same day referral rate for investigations/ treatments averaged 58% (range 52%-66%). Both discharge rates and booking for surgery rates were increased as compared to the previous model by 12%.

There was an overwhelming positive patient feedback .96% thought it was a better and efficient experience and 92% preferring this clinic model .

Cost analysis showed an overall saving of costs incurred with this model by decreasing overall DNAs and increasing discharge and surgery conversion rates.

Conclusion: “One stop clinic model” has been an enormous service improvement with great increase in patient satisfaction and overall cost savings. It aligns with the national drive to reduce follow ups and .making the service more patient centred. We would want to promote this as a model for the future of f&a clinics.

P4

Salvage of failed total ankle replacement using a custom 3D printed titanium truss cage: a case series and suggested treatment pathway

T. Lewis¹, R. Walker¹, Y. Alkhalfan¹, A. Latif¹, A. Abbasian²

¹Guy’s and St Thomas’ NHS Foundation Trust, Trauma and Orthopaedics, London, United Kingdom,

²King’s College Hospital NHS Foundation Trust, King’s Foot and Ankle Unit, London, United Kingdom

Background: The management of failed total ankle replacements, with significant loss of bone stock, is challenging with high rates of complications and associated morbidity. Recent technological advances have enabled the development of patient-customized 3D-printed titanium truss arthrodesis implants which potentially offer an alternative salvage option for failed total ankle replacements.

Methods: A prospective observational study of five cases of failed total ankle replacements which were managed using custom patient-specific 3D-printed titanium truss arthrodesis implants. Technical tips, classification and a treatment algorithm were developed based on our initial experience.

Results: Between November 2018 and February 2020, 5 patients underwent arthrodesis for failed total ankle replacements. Follow up was available for 4 cases. The mean follow up was 2.0 years. The mean MOXFQ Index improved from 73.8 to 31.6 (p<0.05). The mean EQ-5D-5L Index improved from 0.310 to 0.730 and the EQ-VAS also improved from 48.8 to 83.8. The mean VAS-Pain score at final follow up was 25.7. There were no cases of non-union.

Conclusion: Custom patient-specific 3D-printed titanium truss arthrodesis implants are a viable alternative treatment option for failed total ankle replacements.

A modular augmented arthroplasty system to manage larger bone defects in the ankle: a case series

R. Martin¹, M. Dean², R. Kakwani¹, A. Murty¹, I. Sharpe², D. Townshend¹
¹Northumbria Healthcare NHS Foundation Trust, Trauma and Orthopaedics, Cramlington, United Kingdom,
²Royal Devon and Exeter Hospital, Princess Elizabeth Orthopaedic Centre, Exeter, United Kingdom

Introduction: Large bone defects such as those encountered after failed total ankle arthroplasty have previously been a relative contraindication to revision arthroplasty due to inadequate bone stock. We describe our early experience and patient reported outcomes with a novel modular ankle replacement system that includes tibial and talar augments.

Methods: This is a retrospective case series of patients who underwent a total ankle arthroplasty using the INVISION system across two centres between 2016 and 2022. Local approvals were granted. Patients completed the Manchester-Oxford Foot Questionnaire (MOXFQ), Ankle Osteoarthritis Scale (AOS) and EQ-5D-5L pre-operatively and then post-operatively at 6 months, 1 year, 2 years, 3 years and 5 years. Medical records were reviewed for complications and re-operations. Radiographs were reviewed for cysts or radio-lucencies and alignment.

Results: 17 patients were included in the study; 14 men and 3 women with an average age of 67.9 years (range 56 years to 80 years). The average follow up post operatively was 40.5 months (range 7 to 78) at the time of this study. The indication for surgery was revision of failed TAR in 16 and revision of failed ankle fusion in 1. An augmented tibia was used in 3, an augmented talus in 9, and both augmented tibia and talus in 5 cases.

There was one post-operative medial malleolar fracture and one patient underwent debridement and implant retention for late deep infection. No implants have been revised.

The average MOXFQ score improved by 19.3 points at most recent follow up. The average AOS score improved by 25.2 points.

Conclusion: The early results of a modular augmented ankle arthroplasty system have shown satisfactory patient outcomes with a low complication and re-operation rate and presents a viable option for patients with larger bone defects. Longer term follow up is required to determine implant survivorship.

The outcomes of complex primary Inbone total ankle replacement

A. Jamalfar¹, M. Kakwani¹, R. Kakwani¹, D. Townshend¹, A. Murty¹
¹Northumbria Healthcare NHS Foundation Trust, Newcastle upon Tyne, United Kingdom

Introduction: The Inbone prosthesis is a third-generation total ankle arthroplasty (TAAs), consisting of modular stem components inserted into the tibia and talus. In comparison to other prostheses, the Inbone offers increased stability, structural support and improved correction of malalignment and revisions. This is at the expense of more bone excision compared to resurfacing type of prosthesis. We present the radiological, functional and operative outcomes of all consecutive patients operated with the Inbone prosthesis at our institute.

Methodology: All patients with a primary Inbone prosthesis operated at our trust, from June 2013 to June 2021, were included. Patient demographics, indications using the Canadian Orthopaedic Foot and Ankle Society (COFAS) ankle arthritis classification system, complications and radiological outcomes were recorded. Functional outcomes reported by the patients included: Manchester-Oxford Foot Questionnaire (MOXFQ), EuroQol-5 Dimension (EQ-5D) and the Visual Analogue Score (VAS).

Results: Total of 69 patients underwent primary Inbone TAA (M:F 47:23; average age = 71 years; range: 48 to 90 years). According to the COFAS grading system, patients included in the study were Grade 1 (1 patient) Grade 2 (13 patients) Grade 3 (20 patients) Grade 4 (29 patients). The minimum follow-up was 1 year (range: 1 to 8 years). Overall, there was a statistically significant improvement in the average outcome score (pre/post-operation): 62/29 in MOXFQ, EQ5D Index value of 0.39/0.69, and VAS scores of 26.7/10.0. However EQ5D VAS score of 69.9/70.5 was not statistically significant (p=0.82). The average improvement in the coronal deformity correction was 9 degrees. There were no implant revisions. Complications included a periprosthetic fracture of the distal tibia and two cases of DAIR procedure.

Conclusion: The Inbone TAA is a safe and successful procedure for end stage ankle arthritis with deformities around the foot and ankle.

Retrospective cohort study of union rate in tarsometatarsal joint arthrodeses

N. Carroll¹, R. Martin¹, J. Coorsh¹, R. Kakwani¹, A. Murty¹, D. Townshend¹
¹Northumbria NHS Foundation Trust, North Shields, United Kingdom

The aim of this study was to assess type of fixation on success of tarsometatarsal joint arthrodesis. Primary outcome was union at 3 and 12 months.

Medical records were reviewed for demographics, diabetes and smoking status, implant, and indication for surgery. There were 139 consecutive tarsometatarsal joint (TMTJ) fusions in 134 patients. 27 male:111 female, average age 60.9. 75 were isolated TMTJ fusions, 64 multiple TMTJ fusions. 70 used compression plates (43 Stryker Claw2, 27 Synthes VA), 22 used compression screws across the joint, 47 used a combination of the above.

The overall union rate at 3 months and 12 months was 85% (118/139) and 89% (124/139) respectively. The overall rate of broken metalware was 8% (11/139), and revision rate was 2% (4/139). Diabetes was a predictor of non-union (3 months OR 3.78 p=.034; 12 months OR 3.77 p=.023 respectively). The rate of union was greater in single joint fusion vs multiple joint fusion (3 months OR 5.0 p=.003, 12 months OR 6.1 p=.003 respectively). There was no significant difference in the rate of union for the use of bone graft (3 months OR 0.29 p=0.09, 12 months OR 0.2 p=0.11 at 12 months), or smoking (OR 0 at 3 and 6 months), as independent variables. We found no significant difference in rate of union based on indication for surgery. Claw2 used in isolation were found to have a higher rate of non-union at 3 months and at 12 months compared to other methods (10/35 and 8/35 respectively; chi square= 3.87 and 4.90 respectively; p=.049 and 0.026 respectively). We found no significant difference in union rates between other methods of fixation.

In this series, multiple TMTJ fusion, diabetes, and the use of the Claw 2 system without adjunct compression screws were independent predictors of non-union.

COSMIC feasibility study - comparing open scarf osteotomy and minimally invasive chevron osteotomy for hallux valgus correction

A. Pujol Nicolas¹, M. Kakwani¹, A. Griffiths¹, N. Hutt², D. Townshend¹, A. Murty¹, R. Kakwani¹
¹Northumbria Healthcare NHS Foundation Trust, North Shields, United Kingdom,
²Gloucestershire Royal Hospital, Gloucester, United Kingdom

Background: Minimally invasive surgery (MIS) has gained popularity for hallux valgus correction. Current evidence shows similar outcomes to scarf osteotomy (SO), however there are limited randomised controlled studies (RCT). The aim of this study was to assess the feasibility of conducting a RCT to compare the patient recorded and clinical outcomes for the surgical management of Hallux Valgus between SO and MIS.

Methods: Patients suitable for surgical correction of moderate hallux valgus were invited to participate. Patients completed a validated questionnaire (Manchester Oxford Foot questionnaire and EQ-5D-5L) preoperatively and post-operatively at 6 months and 1 year. Radiological parameters and range of motion (ROM) were measure pre and post operatively.

Results: 31 patients were recruited between Dec 2017 and June 2022. 17 patients were randomised to MIS (15 female, mean age 51) and 14 to SO (13 female, mean age 51). Both groups had a significant improvement in all MOXFQ parameters at 6m and 12m, as well as radiological parameters. VAS improved for SO at 6m (p=0.048) and 12m (p=0.025) but only improvement at 6m was seen for MIS (p=0.059). There was no significant improvement in EQ-5D in either group at 12 months and no significant difference in surgical time (p=0.53). Higher number of complications were seen in MIS with 5 removal of metalwork (29.4%) and 2 superficial infections (11.8%) vs none in SO. The dorsiflexion significantly improved in the SO group at 6months (p=0.04). No patients were lost at follow up.

Summary: Both surgical options show similar clinical results, but higher complication rates were seen with MIS. A larger study is needed to evaluate further. This was a difficult study to recruit to. Challenges included: surgeon equipoise, patient preference, prior approval ticket restriction, training requirement and Covid 19- pandemic which could be mitigated in a larger multicentre study.

A retrospective comparison of single screw vs dual screw fixation of Medial Malleolus Fractures on rate of non-union and malreduction

J. Aamir¹, R. Caldwell¹, S. Long¹, S. Sreenivasan¹, J. Mavrotas¹, A. Panesa², S. Jeevaresan², V. Lampridis¹, L. Mason¹

¹Aintree University Hospital, Liverpool, United Kingdom,

²University of Liverpool, Medical School, Liverpool, United Kingdom

Background: Medial Malleolus Fractures (MMF) are frequently managed by orthopaedic surgeons and are one of the most treated fractures of the ankle. Currently, there is a lack of consensus on the number of screws used in fixation when attempting lag-screw fixation of MMF.

Aim: To compare the outcomes of MMF with patients which have either undergone single-screw (SS) or dual-screw (DS) fixation.

Methods: Patients who had undergone surgical fixation of their MMF were identified from 2012 to 2022. Analysis of their pre-operative, intra-operative and post-operative radiographs was performed to determine the initial type of injury and surgical outcomes.

Results: A total of 653 patients were identified across a 10-year period. There were 271 patients (41.50%) in the SS group and 382 patients in the DS group (58.50%).

When comparing the outcomes of SS to DS, a non-union rate of 19.19% (52/271) was found in the SS group as compared to 18.85% (72/382) in the DS group. Re-operation occurred in 14.76% (40/271) in the SS group and 13.02% (44/382) in the DS group. These comparisons were not statistically significant. There was a malunion rate of 11.07% (30/271) in the SS group as compared to 3.93% (15/382) in the DS group, which was statistically significant (p<.001).

On multi regression analysis, factors which gained significance for development of non-union was non-fixation of syndesmosis (p= .039), ankle dislocation on arrival (p<.001) and non-restoration of fibular length (p<.001). Other factors which showed significance for failure to achieve medial anatomical reduction was non fixation of syndesmosis (p<.001).

Conclusion: Use of a SS, rather than DS showed a significant increase in anatomical reduction but did not increase non-union or reoperation rate. Syndesmosis fixation has clear impact on the stresses on the medial malleolus, and surgeons should have a low index of suspicion of injury and fixation.

Outcomes from tibiototalcalcaneal nailing versus open reduction internal fixation for high-risk fragility ankle fractures: a single-centre matched retrospective cohort study

A. Hrycaiczuk¹, K. Oochit², A. Imran², E. Murray¹, P. Chan¹, R. Carter¹, B. Jamal¹

¹Queen Elizabeth University Hospital, Glasgow, United Kingdom,

²University of Glasgow, Glasgow, United Kingdom

Introduction: Tibiototalcalcaneal nailing (HFN) is a proposed solution to successfully treating high-risk ankle fragility fractures. We aimed to determine whether outcomes in our trauma centre reflect those previously reported and support that HFN and open reduction internal fixation (ORIF) demonstrate equal results in this demographic.

Methods: Outcomes for fragility ankle fractures treated with HFN (without joint preparation) or ORIF were compared via retrospective cohort study. 64 patients were matched 1:1 based on gender, age, Charlson Comorbidity Index (CCI) and ASA. Fracture classification, complications, discharge destination, union rates, FADI scores and patient mobility were recorded.

Results: Cohorts were well matched; mean age was 78.4 (HFN) versus 78.3 (ORIF), ASA 2.9 (HFN) versus 2.8 (ORIF) and CCI equal at 5.9. Median follow up duration was 26 months.

Time to theatre from injury was 8.0 days (HFN) versus 3.3 days (ORIF). There was no difference in 30-day, 1-year, or overall mortality. Kaplan-Meier survivorship analysis showed the mean time to mortality in deceased patients was shorter in the HFN group (20.3 months versus 38.2 months, p=0.013). There was no significant difference in the overall complication rate (46.9% versus 25%, p=0.12). The re-operation rate was twice as high in HFN patients; however, this was not statistically significant. There was no statistical difference in FADI scores 72.1±12.9 (HFN) versus 67.9±13.9 (ORIF) nor post-operative mobility status.

Conclusion: HFN demonstrated broadly equivalent results to ORIF in high-risk ankle fragility fractures. Mean survival was however shorter in the HFN group. This may be due in part, to delay to theatre, as HFN was treated as a sub-specialist operation in our unit at the time. We propose that both HFN and ORIF are satisfactory options in frail patients and the priority should be expedient operating. Further randomised control studies are needed to guide a working consensus.

Readmissions and complications following total ankle replacements: a data linkage study using the National Joint Registry and NHS Digital

E. Toby¹, I. Sharpe², A. Goldberg³

¹Plymouth Hospitals NHS Trust, Plymouth, United Kingdom,

²Royal Devon and Exeter NHS Trust, Exeter, United Kingdom,

³Wellington Hospital, London, United Kingdom

Introduction: There is a risk readmissions and complications following ankle replacements. Despite the increase in the numbers performed, there is limited evidence on the number of these complications.

The aim of this cohort study was to determine the 30 day and 90 day readmission rates following total ankle replacement. Secondary aims were to determine the incidence of pulmonary embolism, surgical procedures and the risk factors for readmission.

Methods: A data linkage study combined National Joint Registry (NJR) Data and NHS Digital data. 30 day and 90 day readmissions were recorded. Multivariable logistic regression was performed to analyse potential risk factors for failures for readmissions.

Results: A total of 5562 underwent an ankle replacement between between 1st April 2010 and 31st December 2018. The 30 day readmission rate was 3.2%and the 90 day readmission rate was 7.6%. The 30 day re-operation rate was 0.4% and 90 day re-operation rate was 1.13%. The incidence of pulmonary embolism was at 0.13% at 90 days.

Conclusion: There is a 3.2% 30 day readmission rate following total ankle replacement. The risk of medical complications including pulmonary embolism is low. This study demonstrates the safety of total ankle replacements.

Risk factors for failure of total ankle replacements: a data linkage study using the National Joint Registry and NHS Digital

T. Jennison¹, I. Sharpe², A. Goldberg³

¹Plymouth Hospitals NHS Trust, Plymouth, United Kingdom,

²Royal Devon and Exeter NHS Trust, Exeter, United Kingdom,

³Wellington Hospital, London, United Kingdom

Introduction: Despite the increasing numbers of ankle replacements there remains debate about which patients should undergo an ankle replacement and there are limited studies analysing risk factors for failure of an ankle replacement.

The primary aim of this study is to analyse the risk factors for failure of total ankle replacements.

Methods: A data linkage study combined National Joint Registry (NJR) Data and NHS Digital data. The primary outcome of failure is defined as the removal or exchange of any components of the implanted device. Kaplan Meier survival charts were used to illustrate survivorship. Multivariable Cox proportional hazards regression models were fitted to analyse potential risk factors for failures or ankle replacements.

Results: The overall 5-year survival was 90.2% (95% CI 89.2%-91.1%). In multivariable (adjusted) Cox regression models only age (HR 0.96, 95% CI 0.94 to 0.97), BMI (HR 1.03, 95% CI 1.01 to 1.06) and indication (HR 0.88, 95% CI 0.80 to 0.97) were associated with an increased risk of failure.

Conclusion: This study has demonstrated an overall 5 year survivorship of 90.2% and that younger patients, and those with an increased BMI have an increased risk of failure. We also showed that rheumatoid patients appeared to do better than those with osteoarthritis.

Outcomes following extracorporeal shockwave therapy for the treatment of insertional and non-insertional Achilles tendinopathy at 2 year follow-up: a retrospective review

J. Butler¹, D. Zheng², B. DeClouette¹, C. Walls¹, G. Jejelava¹, M. Azam¹, J. Kennedy¹

¹NYU Langone Health, Orthopaedics, New York, United States,

²John Peter Smith, Fort Worth, United States

Introduction: The purpose of this retrospective clinical study was to evaluate outcomes following extracorporeal shockwave therapy (ESWT) for the treatment of Achilles tendinopathy.

Methods: This retrospective cohort study included clinical data from 95 patients who underwent ESWT for insertional (IAT) or non-insertional (NAT) Achilles tendinopathy between 3/3/2017 to 2/8/2022 with a minimum of 1 year follow-up. Data regarding patient demographics, subjective clinical outcomes, radiographic outcomes, treatment characteristics, complications and failures were recorded. Failure was defined as no improvement in VISA-A nor VAS scores and/or surgical intervention. Subgroup analysis was conducted to identify predictors of poor outcomes. Paired student's t-tests and Welch's t-tests were calculated. Regression analysis was carried out to identify predictors of poor outcomes.

Results: In total, 95 patients (109 ankles) with a mean age of 54.1 ± 14.0 years underwent ESWT for Achilles tendinopathy at a mean follow-up of 25.7 ± 15.0 months. Thirty-nine patients were in the NAT cohort and 56 patients were in the IAT cohort. Both NAT and IAT cohorts had a similar improvement in VISA-A score (p=0.365), VAS scores (p=0.65) and demonstrated a similar return to play time (p=0.34). There was a higher failure rate in the IAT cohort (51.8%) than the NAT cohort (23.1%). Patients who received platelet-rich plasma (PRP) had a higher failure rate (71.4%) than those who did not receive PRP (19.6%). Regression models found that treatment with PRP, MRI severity and female sex were associated with worse outcomes.

Conclusion: This retrospective study demonstrated a high failure rate at short-term follow-up in patients who underwent ESWT for insertional Achilles tendinopathy. Predictors of poor outcomes included treatment with PRP, MRI severity and female sex. Further studies with larger patient cohorts and longer follow-up are necessary to determine the role of ESWT in the treatment of Achilles tendinopathy.

Ankle fusion and ankle replacement - variations in surgical practice across England

T. Jennison¹, R. Zaidi², A. Goldberg³, D. Townshend⁴

¹Plymouth Hospitals NHS Trust, Plymouth, United Kingdom,

²Kings College, London, United Kingdom,

³Wellington Hospital, London, United Kingdom,

⁴Northumbria Healthcare NHS Foundation Trust, North Shields, United Kingdom

Introduction: The definitive surgical treatment of end stage ankle arthritis is either an ankle fusion (AF) or total ankle replacement (TAR). It is anticipated that patients' exposure to treatments differs depending on their post code and access to services. The aim of this study was to determine the variation in practice for the surgical treatment of ankle arthritis across England.

Methods: A retrospective cohort study was performed by searching hospitals episodes statistics (HES) from NHS Digital for all admissions in England between 1st April 2017 and 31st September 2022. OPCS-4.9 codes were used to determine the surgical procedure performed. Basic statistical analysis was undertaken

Results: Overall 12,801 patients underwent surgery for end stage ankle arthritis. Of these there were 9013 (70.4%) AF and 3,788 (29.6%) TAR. Of the 9013 AF, 7034 (77.8%) were isolated AF and 1979 (15.5%) were combined with fusion of additional hindfoot joints.

There was a significant variation in the proportion of AF and TAR with the ratio of AF:TAR varying more than two-fold.

The number of patients that underwent surgery was 19.2% lower in 2022 compared to 2017 (2242 v 2774).

Expressed as a percentage of total volume of cases, the proportion of TAR performed for end stage arthritis was significantly higher in 2022 than in 2017 (31.0% v 26.3%, p<0.001)

Conclusion: Patients with end-stage ankle arthritis are twice as likely to have an AF over a TAR. Numbers of TAR were increasing year on year but fell during Covid. Despite return to normality, the number of surgeries in 2022 have still not caught up with pre-Covid numbers. The proportion of TAR of total surgeries is increasing. Large variations in surgical practice were found based on geographical location. This data should be useful in the development of foot and ankle services nationally.

Wasting everyone's time – an observational study of current practice after injections

C. Flood¹, A. Carne², B. Singh¹, M. Solan²

¹Medway Maritime Hospital, Gillingham, United Kingdom,

²Royal Surrey County Hospital, Guildford, United Kingdom

Introduction: Injections are offered to thousands of patients suffering with a range of musculoskeletal conditions every year. Most are cortisone injections.

Each injection serves both a diagnostic and a therapeutic purpose. The initial response to injection (Local Anaesthetic) helps confirm the clinical diagnosis. The duration of pain relief (steroid) is unpredictable.

These dual goals make planning follow-up appointments difficult. A delayed appointment might affect patient recall about the extent of initial benefit. At an early review, the benefits will usually still be apparent, precluding useful planning.

As a prelude to improving efficiency, we sought to establish current practice in our region of the UK, and among the BOFAS membership.

Method: An online questionnaire was administered to clinicians who treat patients with injections.

Results: 256 responses were included in the analysis. These included 138 foot & ankle surgeons and 119 other specialists.

Foot & ankle surgeons mostly administer injections in theatre (40.5%) or the imaging department (35.7%). In other specialties outpatient department injections predominate (54%). This may reflect the diagnostic intent and anatomical complexity of injections in the foot and ankle setting.

Routine follow-up appointments were given in >80% of cases for first injections and >50% of subsequent injections by all clinicians.

Routine appointments are almost all at six to twelve weeks post-injection. This is the case for first and subsequent injections.

At follow-up, the vast majority of injections were still working.

Immediate pain relief and duration of effect are the most influential factors when planning further treatment.

Conclusion: This data shows that the traditional six to twelve week follow-up appointment after injection is inefficient, and therefore a waste of both clinician and patients' time. Strategies to record pain scores and invite review only when the benefits of injection have faded have the potential to save millions pounds of healthcare costs.

Rivaroxaban vs LMWH after elective foot and ankle surgery – audit and experience from a tertiary referral centre

T.M. Mamballi¹, I. Hassan¹, S. Patel¹, N. Cullen¹, M. Welck¹, K. Malhotra¹

¹Royal National Orthopaedic Hospital, Foot and Ankle Unit, Stanmore, United Kingdom

Background: In the UK, NICE recommends injectable low-molecular weight heparin (LMWH) for chemical prophylaxis of venous thromboembolism (VTE) after elective foot and ankle surgery (NG89-2018). However, due to challenges surrounding administration, monitoring and compliance, our trust switched to oral anti-coagulants (Rivaroxaban) in 2022. The aim of this audit was to compare Rivaroxaban and LMWH, looking at VTE rate and complication profile.

Methods: This was a retrospective audit at a single, tertiary centre. Adult patients undergoing elective foot and ankle surgery and treated with chemical anticoagulation were included. We compared patients treated with Tinzaparin (6-month period in 2019) and Rivaroxaban (6-month period in 2022). Patients on pre-existing alternative anti-coagulants were excluded. At our centre complications data is collected prospectively, and a review of this database and clinic notes was conducted. A chi-squared test was used to assess significance of differences.

Results: In the Tinzaparin group there were 110 patients and 20 had minor complications (18.2%): 4 superficial wound infections (3.6%), and 16 patients required excessive dressing changes due to persistent exudate or slower healing (14.5%). There were no haematomas, returns to theatre, or VTE. In the Rivaroxaban group there were 107 patients and 23 had complications (21.5%): 1 superficial wound infection (0.9%), 1 case of post-operative bleeding followed by haematoma (0.9%), 19 cases with increased dressing changes (17.8%), and one case of VTE two weeks after completing treatment (deep vein thrombosis, 0.9%). None of these differences were statistically significant. Amongst those with wound complications, there were more cases performed for revision / infection in the Rivaroxaban group.

Conclusion: Overall, Rivaroxaban appears effective and safe, with a comparable complication profile to LMWH. The small differences between groups may be explained by differences in the sampled cohorts. Larger scale studies are required to determine whether observed differences are truly non-significant.

Tibialis posterior tendon entrapment in posterior malleolar and pilon injuries of the ankle: a retrospective analysis

J. Aamir¹, A. Syziu², L. Andritsos¹, R. Caldwell¹, L. Mason¹

¹Aintree University Hospital, Liverpool, United Kingdom,

²University of Liverpool, Medical School, Liverpool, United Kingdom

Background: The Tibialis Posterior tendon (TPT) is the only tendon to come into contact with the distal tibia and is therefore at greatest risk of injury in fractures of the distal tibia. Although TPT injury has been reported rarely with injuries around the ankle they often have been missed and present late.

Aim: Our aim was to analyse the rate to TPT entrapment in fractures involving the posterior tibia i.e. Pilon and posterior malleolar fractures (PMF).

Methods: A retrospective analysis of Pilon and PMFs over a 10-year period was undertaken. Patients who had undergone surgical fixation of their PMF or Pilon fractures were identified from our prospectively collected database between 2012 and 2022. Any fracture which had undergone a preoperative CT was included. Analysis of their pre-operative CT imaging was utilised to identify TPT entrapment, where if ≤50% of the tendon cross section was present in the fracture site this was denoted as a minor entrapment and if >50% of the tendon was present in the fracture site was denoted as major.

Results: A total of 207 patients were identified for further analysis, 158 had a Pilon injury and 56 who had a PMF. The incidence of TPT entrapment was 20.77% (n = 43) with 39 minor and 4 major entrapments. If the fracture entered the TPT sheath, there was a 43.30% (42/97) of entrapment as compared to 0.91% (1/110) in fractures not entering the sheath (p<.001). TPT was significantly more common in PMF as compared to Pilon fractures (p=.001).

Conclusion: In our assessment, there was a significant risk of TPT entrapment when the CT images display the fracture line entering the tendon sheath. We recommend that surgeons consider pre-operative imaging in Pilon and PMFs and to actively look for TPT entrapment intraoperatively where entrapment does occur on CT.

The arterial risk posed by the posterolateral approach to the ankle. An anatomical cadaveric observational study

A. Gomaa¹, N. Heeran¹, L. Mason^{2,3}, A. Bond¹

¹University of Liverpool, Human Anatomy and Resource Department, Liverpool, United Kingdom,

²Liverpool University Hospital NHS Foundation Trust, Liverpool Orthopaedic and Trauma Service, Liverpool, United Kingdom,

³University of Liverpool, Institute of Life Course and Medical Sciences, Liverpool, United Kingdom

Introduction: The most commonly used approach for posterior malleolar access is the posterolateral approach. This approach gives good access to the fibula and lateral aspect of the posterior tibia, however; there is little known on the vascular risks with this approach.

Aim: The aim of this study was to assess and describe the anatomy of the peroneal artery and its branches at the ankle region.

Methodology: Eleven cadaveric foot and ankle specimens were dissected in layers, preserving the peroneal artery, anterior tibial artery (ATA) and posterior tibial artery (PTA).

Results: The peroneal artery was consistently found between the peroneal compartment and deep muscular compartment of the posterior leg. A wide range of anatomical variation was found in the peroneal artery, in its location, muscular branches, anastomosis and anterior perforating branch. A variable anterior perforating branch of the peroneal artery (36.36%), a superficially located peroneal artery (27.27%), a variable anastomosis between the peroneal artery and PTA (27.27%), and a variable anastomosis between the ATA and peroneal artery (45.45%). The peroneal artery was the largest diameter artery in one specimen.

The mean proximal distance between the medial malleolus and the posterior communicating branch of the peroneal artery was 37.93mm (range: 19.03- 85.43mm). The mean proximal distance from the medial malleolus to the anterior peroneal perforating artery was 44.23mm (range:35.44-62.32mm). Distal to the anterior perforating branch of the peroneal artery, the peroneal artery was immobile.

Conclusion: Understanding the common variations within the ankle's arterial anatomy can help surgeons protect these vessels from damage during the surgical approach. The posterolateral surgical approach, specifically puts the peroneal artery at risk and knowledge of its anatomy and variability is important when undertaking this approach.

Medium term results of open Autologous Matrix-Induced Chondrogenesis (AMIC) procedure in osteochondral lesions of the talus

M. Sethi¹, R. Limaye¹, N. Gogi¹

¹University Hospital of North Tees and Hartlepool, Orthopedics, Stockton-on-Tees, United Kingdom

Introduction: The osteochondral lesions of the talus are majorly traumatic and talus is commonly affected, as 60 % of it is covered by cartilage. There is limited potential to heal due to poor regenerative capacity and paucity of blood supply. This study aims to evaluate medium term functional outcome of AMIC procedure for osteochondral lesions of the talus and to correlate the relationship between the size of the lesion,age, functional outcomes and failures. The patients with displaced or partially displaced lesions were included along with those where conservative management failed.

Methods: It was a retrospective study from Jan 2015-March 2019. 25 patients were included from a single centre (Single surgeon), standing radiographs and MRI-pre and post operative were taken for all patients. During the procedure micro fracture was combined with application of Chondro-guide, a porcine collagen type I/III matrix & fibrin glue application Pre and post operative American Orthopedic Foot and Ankle Score (AOFAS) and Visual analogue (VAS) score were done for analysis and follow up- 3 months,6 months, 12 months.

Results: Mean age was 36 years and etiology was 23 traumatic, 2 non traumatic, mean follow up was 24months (95% CI-19.80-28.28), Mean size of the osteochondral lesion was 1,74 cm 2 Mean difference between preoperative and post operative AOFAS score was 49.40 (CI-53.21-45.59)(p<.05) ans VAS score was 5.36CI (4.75-5.97) (p<.05).

Conclusion: AMIC with Chondro-gide matrix procedure for >1 cm 2 osteochondral lesions of talus is a one-step surgical technique with excellent to good results.

5th metatarsal fractures; who do we need actually need to see? A single centre experience

J. Chapman^{1,2}, Z. Choudhury², S. Gupta², G. Airey^{1,2}, T. Davies¹, L. Mason^{1,2}

¹Liverpool University Hospitals NHS Foundation Trust, Liverpool Orthopaedic & Trauma Service, Liverpool, United Kingdom,

²University of Liverpool, School of Medicine, Department of Health and Life Sciences, Liverpool, United Kingdom

Introduction: 5th metatarsal fractures are a common injury of the foot, however the literature on how to manage them is conflicting. Our department protocol states Zone 3 fractures should have face-to-face review, with other zones planned for discharged following virtual review. We sought to investigate whether our practice was consistent and the burden of 5th metatarsal fractures on our clinics.

Methods: Patients referred to our virtual fracture clinic (VFC) with a suspected or confirmed 5th metatarsal fracture were identified from our electronic database. Data was collected on VFC outcomes including telephone review, clinic reviews and requirement of surgery. Plain AP radiographs were reviewed for fracture morphology. Fractures were defined as Zone 1.1, 1.2, 1.3, 2, 3, diaphyseal shaft, distal metaphysis and head. A univariate linear regression model was used (SPSS v.27).

Results: 1391 patients were identified. 447 (32.1%) were planned for clinical review following VFC, however 568 (40.8%) were sent clinic appointments (McNemar p<.001). Only fractures in Z1.1 were significantly associated with a plan to discharge from VFC (OR 2.851, p<.001), with Z3 associated with a plan to review in person (p<.001). Following telephone review, Z2 (OR 1.387, p=.034) and Z3 (OR 3.285, p<.001) fractures were the only fractures significantly associated attending a face-to-face clinic appointment, with Z1.1 (OR 0.573) and Z1.2 (OR 0.642) negatively associated. Z3 (OR 4.639, p<.001) retained significance for attending >1 clinic appointment and requiring surgery (OR 3.895, p=.037). Surgery was required in only 1.1% of patients, with 60% of these for non-union.

Conclusions: Fractures of Z2 and 3 require the most face-to-face input. Whilst rare, Z3 is the most likely to require surgery, often for non-union. Based on these results, all Z2 and 3 fractures should be considered for at least one face-to-face review and it may be appropriate for this to be a delayed.

P21

Is there improvement in plantar pressures patterns following total ankle replacement? – A prospective novel 1 year follow up study

S. Hakeem¹, J. Ramaskandhan¹, S. Galloway¹, K. Smith¹, M. Siddique¹

¹Freeman Hospital, Newcastle, United Kingdom

Introduction: The aim of this study was to investigate plantar pressures changes with gait in patients presenting with ankle arthritis pre and post TAR.

Patients and methods: 11 patients were recruited to this study. Patients who were listed for a primary TAR with a 3 component mobile bearing prosthesis were included. Exclusion criteria included refusal of consent, previous surgery to foot, h/o infection, peripheral vascular disease, neurological disease and other LL joint replacements. Gait analysis was carried out using TekscanTM plantar pressure analysis system and plantar pressures were recorded pre-operatively and 1 year post-operatively. Gait asymmetries were recorded in Percentage for ST parameters.

Results: 11 patients were recruited. Mean age were 70.5 years. Improvement centre of pressure pattern restoration and Force percentage curve (FP) patterns from pre-op to 1 Year. Improvement in foot progression angle was seen in 6 out of 11 patients (54.5%).

Plantar pressure analysis showed deviation from reference ranges for 1) differences in centre of pressure (COP) 2) changes to hindfoot vs. forefoot loading ratio 3) change in loading pattern at heel in KPa (p<0.05) 4) differences in gait parameters (reduction in cadence, walking velocity, increase in active propulsion time; p<0.05) 5) changes to foot progression angles. These findings correlate with MOX-FQ scores (Positive Correlation p>0.565) for pain, difficulty with walking/ standing and difficulty with social activities. Gait asymmetries improved significantly (p<0.05) from pre-op to 1 year for step velocity (76.1 to 93.4 in 6/11 patients) and mid stance time (76.04 to 93.5% in 8/11patients).

Conclusion: This study shown that TAR surgery helps in restoring centre of pressure, force percentage curve patterns and reduces asymmetries in step velocity and mid stance times during gait at 1 year post surgery. Plantar pressure analysis is a useful tool to study improvement in function in this patient group.

P22

Total ankle replacement: the effect on gait and physical activity – a prospective 1 year follow up study

M. Douglas-Harris¹, J. Ramaskandhan¹, K. Smith¹, S. Galloway¹, M. Siddique¹

¹The Newcastle upon Tyne Hospitals NHS Foundation Trust, Department of Orthopaedics, Newcastle upon Tyne, United Kingdom

Introduction: Total Ankle Replacements (TAR) is performed to optimise biomechanical function and facilitate improved mobility. However, there is little data on how spatiotemporal parameters and activity levels change post-surgery. We aimed to study improvement in Gait parameters and its association with Physical activity in patients who underwent TAR.

Methods: This was a prospective observational clinical study carried out with ethics permission and approvals for a single centre cohort. Patients who underwent TAR during the period of 2015 – 2018 were approached for study participation. Spatio-temporal parameters were measured by instrumented Gait Analysis (Tekscan TM Walkway system) with a recording of 6 x 5 meter walking trials preoperatively and 1-year post op. Patients completed a questionnaire containing the International Physical Activity Questionnaire (IPAQ). The change between pre and post-operative values was calculated and tested for significance.

Results: 10 patients were recruited for the study. Mean age of patients were 70.4 years. There were improvement in spatiotemporal and IPAQ parameters as whole group changes in one measurement domain did not achieve statistical significance (P=<0.05). However, there were areas where subject specific changes in spatiotemporal data positively correlated with IPAQ data changes. This was in the area of bilateral stride time (Pearsons = 0.9074 and 0.9109) (IPAQ 19) and stride length on the operated side (IPAQ 14) [0.7686], 15a [0.8564], 26 [0.932] and 27 [0.932]). These domains concerned increased days and hours spend doing vigorous physical activity outdoors and moderate physical activity indoors. Stride length was also positively correlated with time-spent sitting down.

Conclusion: TAR helps in improving Gait and Physical activity parameters in patients at 1 year post-operatively. There were subject specific changes in spatiotemporal data that meant it would not be appropriate to homogenise the data. There were positive correlations with bilateral stride time and operated stride length with physical activity measures.

P23

Does total ankle replacement help to improve physical activity in patients 2 year post-operatively? A pilot activity monitoring study

S. Hakeem¹, J. Ramaskandhan¹, S. Galloway¹, K. Smith¹, M. Siddique¹

¹Freeman Hospital, Newcastle, United Kingdom

Introduction: Step count and activity monitoring are objective tools to measure improvement in functional ability in patients undergoing Total ankle replacement (TAR); this area is underexplored in literature. Activity monitoring sensors provide additional information on physical activity and energy expenditure in addition to step counts. These carried out in a real-life environment helps us to understand the impact of intervention in improving physical activity.

The aim of this study was to study physical activity patterns in the community in patients who underwent TAR surgery.

Patients and methods: 10 patients who underwent a TAR between 2017 and 2019 were recruited. Exclusion criteria included previous reconstructive surgery, h/o infection, PVD, neurological disease and other joint replacements. Written consent was obtained. Patients were provided with ActivPAL TM activity monitor to wear over a 7-day period along with a self-reported diary to record activity patterns. This was carried out pre-operatively and 2 years. Data from sensors were downloaded and activity patterns were analysed with SPSS IBM 28 statistical package.

Results: 10 patients (7 males, 3 females) were recruited. Mean age of patients were 65.16 years (52.4 to 78.1yrs).there was a trend for improvement in Sitting / Lying (hours) from 121.36 to 132.56 (p=0.367) and Standing (hours) 25.53 to 33.23 (p=0.411), although this did not achieve statistical significance. Step count (in hours) improved from 8.8 hrs to 10.8 hrs (p=0.05); Step count increased from 38544 to 47074 (p=041) from pre-op to 2 years. Energy expenditure (metabolic equivalents) improved from 192.3 to 219.5 (p=0.033).

Conclusion: At 2 years post-operatively, TAR patients showed considerable improvement in step count and energy expenditure compared to pre-operative levels. The results of this novel study helps us to understand the functional improvements in terms of physical activity and energy expenditure gained from TAR surgery.

SPONSORS PROFILES

A Company Built on Ingenuity, Hard Work, and Compassion. What started as a small family business in 1988 has since evolved into a global market leader, providing orthopaedic and medical solutions that improve patient care around the world. Acumed serves highly skilled specialised surgeons who demand comprehensive, high quality medical devices for patients with simple to complex injuries for optimal restoration of function. With more than three decades of experience in the orthopaedic industry, Acumed offers a wide selection of extremity fixation and specialty plates, nails and screws.

The Acumed Ankle Plating System 3 is designed to provide a variety of fixation options for fractures of the distal tibia and fibula. The indication-specific plates address fracture patterns of the medial, lateral, and posterior malleoli. Specialized plate features and unique instrumentation address disruption of the syndesmosis.

Anika is a global joint preservation company that creates and delivers meaningful advancements in early intervention orthopedic care. We partner with clinicians to understand what they need most to treat their patients and we develop minimally invasive products that restore active living for people around the world. We are committed to leading in high opportunity spaces within orthopedics, including osteoarthritis pain management, regenerative solutions, sports medicine and Arthroscopic joint solutions.

The AO Foundation is a charitable organisation, which is dedicated to the promotion of excellence in surgery of musculoskeletal trauma. AO UK & Ireland is the Anglo-Irish section of the foundation and through its education department delivers non-profit making courses in the UK & Ireland to train young surgeons and operating room personnel in the theory and practice of trauma. Membership of AO UK & I consists of a group of established surgeons and ORPs who freely give their time to teach on the 30 courses that are run by AO UK annually. AO UK & I also offer research grants and fellowships.

The AO mission statement is: Promoting excellence in patient care and outcomes in trauma and musculoskeletal disorders

For further information please visit www.aouk.org

Arthrex is a global medical device company and leader in new product development and medical education in orthopedics. With our mission of Helping Surgeons Treat Their Patients Better™, Arthrex has pioneered the field of arthroscopy and develops more than 1,000 innovative products and procedures each year.

Arthrex continues to experience unprecedented growth and demand for our products throughout the world; however, we remain a privately held company with a family business culture committed to delivering uncompromising quality to the health care professionals who use our products, and ultimately, the millions of patients whose lives we impact.

We are dedicated to innovation through scientific research, surgeon collaboration, and medical education to continually advance minimally invasive orthopedics and make the procedures more simple, safe, and reproducible.

So, come and witness Arthrex take the next leap in arthroscopy and take part in our Nano Challenge at booth G1.

Biocomposites is an international medical device company that engineers, manufactures and markets world leading products for use in infection management in bone and soft tissue. Based in Keele, UK, it has global operations across Europe, USA, Canada, China and India.

Biocomposites is a world leader in the development of innovative calcium compounds for surgical use. Its products target a broad spectrum of infection risks across a variety of specialties, including musculoskeletal infection, orthopaedics, trauma, spine, foot and ankle and podiatry. Biocomposites products are now used in over 100,000 procedures per annum and sold in more than 40 countries around the world.

Please visit www.biocomposites.com to learn more.

BONESUPPORT™ sells CERAMENT, synthetic bone substitutes that promote and protect bone healing. There are three CERAMENT products; CERAMENT BONE VOID FILLER, CERAMENT G with gentamicin and CERAMENT V with vancomycin. All three products remodel into bone within 6-12 months, and CERAMENT G and V also elute either gentamicin or vancomycin to provide a high local concentration of antibiotic that protects bone healing. Our products are used when bone defects cannot heal by themselves, for example in trauma, fracture-related infection, chronic osteomyelitis and diabetic foot osteomyelitis. Please visit www.bonesupport.com for more information. BONESUPPORT and CERAMENT are registered trademarks of BONESUPPORT AB.

The DePuy Synthes Companies are part of the Johnson & Johnson Family of Companies. We offer one of the world's most comprehensive portfolios of orthopaedic products and services for joint replacement, trauma, spine, sports medicine, cranio-maxillofacial, power tools and biomaterials to advance patient care while delivering clinical and economic value to health care systems worldwide.

As a leading medical technology company, Enovis is focused on developing clinically differentiated solutions that generate better patient outcomes and transform workflows.

Powered by continuous improvement, extraordinary talent, and innovation, we are creating better together by partnering with healthcare professionals.

Our extensive range of products, services, and integrated technologies fuels active lifestyles.

Our leading innovative brands AirCast, DonJoy, and Chattanooga are recognized by healthcare professionals across the NHS and Independent Hospital groups, providing patients with world-class products to aid their recovery from injury.

Truly personalised orthopaedic implants and surgical instruments Episurf Medical is endeavouring to bring people with painful joint injuries a more active, healthier life through the availability of personalised treatment alternatives with implants designed for each patient. Episurf Medical's Episealer® personalised knee and ankle implants and Epiguide® PSI surgical drill guides are developed for treating focal chondral and osteochondral lesions. On our website you will find more information on our products, testimonials and publications. If you have any questions, please do not hesitate to contact us. We look forward to interacting with you during this congress!

Exactech was created in 1985 by an Orthopedic surgeon. We exists to improve the quality of life for individuals by maintaining their activity and independence. We do this through innovative ideas, high quality products, education, and commitment to service.

Exactech are presenting the Vantage™ Total Ankle System, which offer an innovative and modern approach to the challenges of Total Ankle Replacement, including the new FlatCut Option for the Talus We are also presenting a range of Biologic Solutions, including the Optecure™ Bone Graft Substitute and the Accelerate™ PRP System.

IGEA Medical is a biomedical company and a world leader in biophysical therapies for bone and joint. Our activities focus on the study of interactions between biological systems and physical stimuli used for therapeutic purposes in musculoskeletal medicine. Our mission is to improve patients' Quality of Life by developing and producing innovative, effective and safe therapeutic systems for clinical practice. IGEA's commitment is reflected in the principle that guides IGEA staff every day: "The culture of scientific research, honesty and moral commitment that brings us closer to people who are suffering have been and will forever be the light that guides IGEA." Dr Ruggero Cadossi, Founder of IGEA.

We are a Sports Medicine products distributor focussing on Quality, Innovation and Service.

Bioretec Absorbable Implants: 4th generation fully resorbing PLGA8515 pins, screws and IM Nails are strong with high fatigue resistance and patented auto-compression.

Chondrotissue: Unique fully resorbable HAMIC (Hyaluronic Acid Matrix Induced Cartilage) implant generates Type II staining collagen Hyaline cartilage in one procedure - supported by strong clinical experience over 12 years in the UK.

NCTB Allografts: Non-irradiated fully HTA licenced soft tissue allografts provided VAT free at the most competitive prices in the UK.

Come and see why our customers keep coming back.

Founded in January 2015, Joint Operations provides a bridge between suppliers of innovative healthcare technologies and clinical teams working within joint & nerve preservation in the UK & Ireland.

Joint Operations partnered with Axogen, are the UK provider of sterilised human nerve graft in a range of lengths and diameters for nerve gap management.

Lavender Medical specialise in supplying innovative extremity products to the orthopaedic community with a particular emphasis on the foot and ankle market. Our organisation represents several leading research-focused manufacturers to bring the latest technology available to the UK. We are dedicated to give the highest level of service to the hospitals and customers that we value and work alongside.

We have a long association with the UK foot and ankle community and are proud to again sponsor the British Orthopaedic Foot and Ankle Society.

Our Gold Sponsorship of this year's conference gives us further opportunity to exhibit our broad portfolio of product choice, as well as being able to demonstrate our commitment to providing fantastic customer support and commitment.

We look forward to meeting with delegates and wish you all a successful and rewarding conference!

Marquardt Medical UK Ltd

Our manufacturing is based in Spaichingen Germany, by our parent company Marquardt Medizintechnik; founded in 1980. Since then, production has been consistently geared towards medical implants.

Thus, Medical engineering solutions by Marquardt Medizintechnik offer the highest level of innovation, quality and service which is the decisive criteria for excellence in medical engineering

medartis®

PRECISION IN FIXATION

Medartis develops, manufactures and sells titanium screws and plates, surgical instruments and system solutions for fracture fixation. These implants allow for patient rehabilitation after surgical

reconstruction of fractures, malunions and deformities or skeletal diseases and their adjacent soft tissues. Medartis is represented worldwide through its subsidiaries and a broad distributor network.

Our motto is "Precision in fixation". We place the highest priority on maintaining stringent quality standards, continuous further development and innovation as well as comprehensive service

provision for surgeons, theatre staff and patients. This enhances long-term customer relations based on partnerships and has formed the foundation for sustainable success since the company's

founding in 1997. The goal of Medartis is to continually improve early functional rehabilitation through its high-quality products and exclusively developed technologies.

medi UK supplies high-quality orthopaedic supports and braces to UK healthcare organisations. Our supports offer stability without limiting mobility, while our range of braces aid recovery through immobilising joints while maintaining mobility. We are dedicated to exceptional customer service and helping healthcare teams achieve the best outcomes for patients

Delivering world-class medical imaging solutions, MIS Healthcare has built its reputation for excellence by providing high end imaging equipment, supplied by renowned manufacturers. MIS Healthcare has remained diversified, supplying a variety of premier products and solutions everything from, Digital Radiography, Ultrasound, Radiation Oncology Systems and PACS Solutions.

At MIS Healthcare we remain driven by our passion for providing high quality imaging solutions in the interest of accurate diagnosis.

Keeps you going.

Oped stands for innovative medical products, comprehensive therapy concepts and fresh impulses in medical technology. The personal care of our customers is as much a concern to us as the accompaniment of the patients to their complete recovery. OPED UK Limited's products can be used in many clinical areas such as Orthopaedics, Trauma, Diabetes and Vascular.

Evidence Based Foot & Ankle Solutions

"For over 20 years, OrthoSolutions has been successfully serving and supporting the foot and ankle speciality clinician cohort. OrthoSolutions has always had a clear focus on the needs of foot and ankle speciality clinicians, and to the patients they treat. From Trauma to Salvation, OrthoSolutions have specific solutions which have been collaboratively designed and manufactured. Our aim at OrthoSolutions is to ensure that, 'clinical need' is the primary rationale for innovation and development – Evidence based foot and ankle solutions!"

Innovation. Forward Thinking.

From the onset, Paragon 28® has made it our goal to re-invent the space of foot and ankle surgery. It is not enough for us to develop products. The key is to think about how every foot and ankle problem is addressed and ask questions. Why is the procedure done that way? How can we streamline the procedure and make it more easily reproduced? How can we lower surgeon anxiety when dealing with specific, complex procedures? Where can techniques and solutions available for less researched procedures be improved? We emphasize the philosophy of innovation through design and carry that through for the entire procedure. To us, it's more than just a locking screw or a surgical plate; it's an entire system that makes foot and ankle surgery go more smoothly.

Our mission is to continuously improve the outcomes and experiences of patients with foot and ankle conditions.

Stryker is dedicated to helping foot and ankle surgeons treat their patients more efficiently, while enhancing patient care and the overall healthcare experience. Constantly driven to innovate, we offer a diverse array of advanced medical technologies and a comprehensive portfolio of products. We're here for the foot and ankle surgeon. We're here to make healthcare better.

The Standing CT Company is a partnership with Orthopaedic Surgeons and Radiologists. We are the leading provider of weight-bearing CT scanning in the UK. Our scanners and mobile services are used by numerous UK institutions including RNOH, Royal Surrey, Barts Health, ROH and several large London independent hospitals to significantly improve the imaging of feet and ankles, knees, hips and upper extremities. The scanners allow bilateral, 3-dimensional imaging in a single 30-second pass with a low radiation dose equivalent to an X-Ray set. Our latest HiRise multi-extremity scanner also allows bilateral, 3D long leg alignment scanning for visualisation from hip to toe. We are proud to be collaborating with Stryker UK to improve access to WBCT for Foot and Ankle Consultants across the United Kingdom. Standing CT and Stryker believe that Better Imaging = Better Outcomes for patients.

TRB Chemedica specialise in biosynthetic Sodium Hyaluronate products:

OSTENIL®, OSTENIL® MINI, and OSTENIL® PLUS are viscosupplements for the treatment of osteoarthritis.

OSTENIL® TENDON: a visco-elastic solution for peritendinous or intrasheath injection designed to restore tendon function by reducing pain and enhancing tendon gliding.

VISCOSEAL®: acts as a temporary post-arthroscopy synovial fluid replacement, thus restoring physiological functions and aiding recovery.

New in 2022:

ArthroZheal®: an autologous bioactive matrix that improves sealing, healing, and tissue regeneration both during and following orthopaedic surgery.

As a dedicated lower extremity company, Vilex truly understands the unique needs that foot and ankle surgeons have while treating patients. We focus on innovation that is driven by surgeon feedback - delivering a powerful portfolio of products created by surgeons, for surgeons. At Vilex, we break the mold of a traditional, large device company. We're reimagining foot and ankle.

With the acquisition of DT MedTech, Vilex has expanded our innovative portfolio to include the Hintermann Series Total Ankle Replacement System. The Hintermann Series Total Ankle, created by Dr. Prof. Beat Hintermann, MD, has culminated a 20+ year history of clinical excellence with over 30,000 implanted world-wide.

We invite you to advance with us, and learn more about the new, expanded Vilex foot and ankle product portfolio.
